From: Ray
Topic: 4377 Message: 4397

Thanks Gary.

I am well aware of this problem. Since this article was written there has been several people that has been let go or has stepped down.

Eric Lindsey I believe was his name was the man person in charge of all the city's radios and electronics. He Left as I understand because he was one of the ones who made a deal with Harris.

It was never even brought before the County Commissioners for a vote. HE just did it!

The warehouse where the Radios are stored is about 5 miles from my home. It is Hurricane Electronics. In Chickasaw, Al

They are trying to install them in the other cities vehicles as fast as they can. You can drive by there and see them working on different city vehicles every day.

It must be a long drawn out process to install 1 radio or there is like only 2 men working there at any giving time.

I had seen on another group post that UpMan said you could receive the City of Mobile on a BCD996P2 scanner.

I don't know if that meant you would have to send that scanner back to Uniden for some kind of update or what.

I heard from someone from MRFD who said that the switch over to the
Harris P25 system is still a few months out.

It's up to you whether or not you want to spend the money for the Pro
Voice upgrade. I did even though I'm only there 2-3 times a year.

The article I mentioned was from at least a year ago and pointed out
that the mobiles and portables were still sitting in their boxes and
that the warranties had expired on them. There were some questions about
the shop doing the work and one of the people from the county having an
inappropriate financial relationship, but I forget the details.

Here is a link to some stories on the subject at the Fox10 website,

http://www.fox10tv.com/category/302083/mobile-county-911-board-investigation

The "P2" in the 996P2 stands for P 25 Phase 2. The scanner will receive that type of trunk system right out of the box. Just to be clear, P25 is an open standard for radio systems. At least in theory, if programmed for a particular system, either a Motorola or Harris P2 capable radio should work on the system. If you buy a 996P2, you'll hear the new system fine as long as it's not encrypted.

As to you other question, I got the information from the FCC license database, http://wireless2.fcc.gov/UlsApp/UlsSearch/searchAdvanced.jsp

Enter "Mobile County Communications District" and you'll get the information. One the call signs is WQWI290 and the Radio Service is SY, which stands for 700 Mhz Public Safety.

As I said, I'll be down in the area at the end of the month and I might get some time to listen.

I'll be on the eastern shore of Mobile Bay, so I won't get to Chickasaw. Or at the least it's unlikely. I've done enough public safety installations over the years, that I know how long they take to do can vary widely depending on the vehicle, the radio, and the skill of the installer. Radios are a lot smaller than when I was installing behemoth Micor radios with dual control heads. :)

Topic: 4377 Message: 4399

Bill,

I do not want to beat a dead horse. I wish I could. There are a lot of them involved in all this mess that should be.

Gary Tanner ex-county commissioner and then the Mobile County Communications Director who was 1 of the people responsible for all this mess with Harris was forced out.

The local police chief will only say the radios are being switched over as quick as they can be and that is all he will say. Yes, it will be digital that much I do know.

They are in process of reworking / installing new equipment on some of the other radio towers within the county. No one will answer the encryption question!!!!?????******

I have asked the Mayor, the 2 female and 2 male council personnel (Council Members) and got the same answer as the Police Chief gave.

I reached out to someone I know who works for the 911 Emergency center and that person told me that The City and County was staying with the Harris Radios

Because of all the money that was spent on this system that was giving to the County by the Federal Government and the Money the County had to put into it.

Now this person says the County does not have the funds to purchase another system. There are questions that should have been asked to The Harris Corp that wasn't

I was told. As I had said in a prior post " It seems like this is a special opps " No one wants to talk about it that is in the know.

IT's crazy and makes no sense at all that you cannot go to the sources and get a straight answer.

Ray

Ray,

Sounds like so much nonsense... Consider this if you will... ANY taxpayer money invested in a new system is subject to public scrutiny. Meaning any citizen merely need ask the city for the history and they give it to you. Your fire chief can't be bothered it seems-his is the day in day out operations of the FD. Purchasing radio Systems isn't left up to vol fire chiefs so he doesn't know and doesn't care to know. To him, a radio is a tool and as long as it does what he needs he's happy. Can't blame home for that. Contact your city alderman or whatever they call your local govt representative and ask him formally to get answers to

your questions about the new system. Is it digital? Will it be encrypted? Etc.

Bill

On Feb 11, 2017, at 11:00 PM, 'Ray' bcd536hp1@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

Bill thanks for your input.

I am friends with the Fire Chief here and this is what he told me. I don’t know if he was shooting straight or not. He always has In the past!!!!!!

That the Harris radios that have been purchased are going into all the Municipalities in the County. Yes that same Radio that The City of Mobile uses. Harris P25 Digital.

He also stated that there was plans once all vehicles were equipped with those radios that they were going to switch to the encrypted signal.

But he says that has been put on hold. I asked him why has the decision about the radios going to encrypting change.

He said he wasn’t told why and he didn’t want to push for an answer We are a small City, Volunteer Fire Dept.

He said he was also told that the County had no immediate plans to purchase any new radio equipment because of the millions of $$$$ already invested

And The County has no more $$$$ for another system

So, I am still in the dark. Like you said Bill, that is a lot of money to sink into a scanner that may or may not work in a few more months.

Thanks’

Ray

Subject: Re: [BCD536HP] New to this group and need help

Ray, Gary,

There seems to be newer info out there that rumors a move to a new system... that may include some level of encryption, or not. Since I'm from Ct. I would recommend doing what I do when I have trouble receiving a system while while traveling on vacation... and that is this... I visit a local fire station and ask around. There is usually a scanner buff who is up on what's going to work. And more importantly, what's NOT going to work. Volunteer firehouses are usually a better bet when it comes to finding one of the scanner guys so checking in with an outlying volunteer community (if the city runs a paid dept may be your best bet. Since RR didn't mention anything about a new system (encrypted or otherwise) the scanner buff in the vol FD might be the better reference. And since RR data is compiled from regular people submitting the latest data, it may not be up to date. Data comes from volunteer submissions (although there are some regional coordinators that are more conscientious than others and do a good job of keeping current.)

I'd hate to see you spend a chunk of cash and learn you may hear what you want now, but won't in the very near future because you were unaware of a planned system change that either included encryption or it as type of system that scanners don't currently receive, and may never receive due to proprietary issues. (In some cases manufacturers developed and own the rights to the way their gear works and will not release or allow others to use it)

Hope this helps,

Bill

Subject: Re: [BCD536HP] New to this group and need help

I'm checking on your information over at Radio Reference. Not that I
don't believe you, but I'm surprised that no one on the Alabama forum
has mentioned this.

Also, if they have moved, you can probably do without the Pro Voice upgrade. There's not a lot of it around the nation and EDACS and Pro Voice are being phased out as Harris has announced that it's End of Life and support will soon stop.

These are the main site frequencies for the new system,

0769.2562
0769.5062
0769.7562
0770.0062
0770.2812
0770.6062
0770.8562
0771.1812
0771.4312
0771.9062
0772.3062
0772.5812
0772.8812
0773.1312
0773.3812
0773.6312

Oh, one last thing. There have been rumors that the new system is going to be encrypted, and if that's true, we're going to be out of luck.

At that point, I would attend a meeting and ask for a commitment that they will not be encrypted and will remain available for the citizens to monitor. Force their hand to commit that it will not be encrypted and will remain open as the previous systems have been.

If they push back using "we don't know", you can push ahead and state that even if encryption capability is available, it need not be used for routine communications such as dispatch calls and operations. Point out that using encryption or not is a decision they can make today.

In short, nip it in the bud.

It's much easier now than it will be to reverse a bad decision later.

It's just exactly what the press is so very interested in. The possibility of wrong doing within the local, state or federal govt is what sells. Even if it's just a royal screwup with no wrongful intent, it still makes for one heck of a story.

All I can say is god help ANY official you mentioned that had knowledge of the buildout of the system and deferred you to others or declined outright to discuss it. It leaves them open to lawsuits on many points of the law. Ask any lawyer, FOI is a very powerful Act. The media use it every time they get stonewalled. If there are any reporters that have written about it, ask them if the FOI Act has been used. Let's see them refuse a court order.

Sorry you have to deal with the likes of those jokers, nice talk,

Bill

I have asked the Mayor, the 2 female and 2 male council personnel (Council Members) and got the same answer as the Police Chief gave.

I reached out to someone I know who works for the 911 Emergency center and that person told me that The City and County was staying with the Harris Radios

Because of all the money that was spent on this system that was giving to the County by the Federal Government and the Money the County had to put into it.

Now this person says the County does not have the funds to purchase another system. There are questions that should have been asked to The Harris Corp that wasn’t

I was told. As I had said in a prior post “ It seems like this is a special opps “ No one wants to talk about it that is in the know.

IT’s crazy and makes no sense at all that you cannot go to the sources and get a straight answer.

Ray,

Sounds like so much nonsense... Consider this if you will... ANY taxpayer money invested in a new system is subject to public scrutiny. Meaning any citizen merely need ask the city for the history and they give it to you. Your fire chief can't be bothered it seems-his is the day in day out operations of the FD. Purchasing radio Systems isn't left up to vol fire chiefs so he doesn't know and doesn't care to know. To him, a radio is a tool and as long as it does what he needs he's happy. Can't blame home for that. Contact your city alderman or whatever they call your local govt representative and ask him formally to get answers to your questions about the new system. Is it digital? Will it be encrypted? Etc.

Bill

On Feb 11, 2017, at 11:00 PM, 'Ray' bcd536hp1@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

Bill thanks for your input.

I am friends with the Fire Chief here and this is what he told me. I don’t know if he was shooting straight or not. He always has In the past!!!!!!

That the Harris radios that have been purchased are going into all the Municipalities in the County. Yes that same Radio that The City of Mobile uses. Harris P25 Digital.

He also stated that there was plans once all vehicles were equipped with those radios that they were going to switch to the encrypted signal.

But he says that has been put on hold. I asked him why has the decision about the radios going to encrypting change.

He said he wasn’t told why and he didn’t want to push for an answer We are a small City, Volunteer Fire Dept.

He said he was also told that the County had no immediate plans to purchase any new radio equipment because of the millions of $$$$ already invested

And The County has no more $$$$ for another system

So, I am still in the dark. Like you said Bill, that is a lot of money to sink into a scanner that may or may not work in a few more months.

Thanks’

Ray

Subject: Re: [BCD536HP] New to this group and need help

Ray, Gary,

There seems to be newer info out there that rumors a move to a new system... that may include some level of encryption, or not. Since I'm from Ct. I would recommend doing what I do when I have trouble receiving a system while while traveling on vacation... and that is this... I visit a local fire station and ask around. There is usually a scanner buff who is up on what's going to work. And more importantly, what's NOT going to work. Volunteer firehouses are usually a better bet when it comes to finding one of the scanner guys so checking in with an outlying volunteer community (if the city runs a paid dept may be your best bet. Since RR didn't mention anything about a new system (encrypted or otherwise) the scanner buff in the vol FD might be the better reference. And since RR data is compiled from regular people submitting the latest data, it may not be up to date. Data comes from volunteer submissions (although there are some regional coordinators that are more conscientious than others and do a good job of keeping current.)

I'd hate to see you spend a chunk of cash and learn you may hear what you want now, but won't in the very near future because you were unaware of a planned system change that either included encryption or it as type of system that scanners don't currently receive, and may never receive due to proprietary issues. (In some cases manufacturers developed and own the rights to the way their gear works and will not release or allow others to use it)

Hope this helps,

Bill

On Feb 11, 2017, at 3:34 PM, 'Ray' bcd536hp1@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

Gary, once again thank you.

I appreciate those frequencies.

I belong to the southalabama group and I have not been able to get anyone to say anything.

It is all like a great big special opps thing going on.

I use to help as many people as I could with the EDACS system. They at one time moved 2 towers and relocated and gave them new frequencies.

Everyone went crazy because they could no longer receive the EDACS system. I took my time and found

All the frequencies and correct LCN’s and posted them on RR years ago and then someone else came behind me and

Changed a few descriptions and then took credit for all my work. One of the Towers is 1 mile from my home.

That is another thing I cannot get any information out of anyone about. Is the County has spent all these millions of

Dollars for these new Harris radios and they are still to this day installing them into all the Units throughout the County. Every City.

I know for a fact that the radios they are installing are NEW Harris Radios. I have seen them up close.

Thank You,

Ray Ray

Subject: Re: [BCD536HP] New to this group and need help

I'm checking on your information over at Radio Reference. Not that I don't believe you, but I'm surprised that no one on the Alabama forum has mentioned this.

Also, if they have moved, you can probably do without the Pro Voice upgrade. There's not a lot of it around the nation and EDACS and Pro Voice are being phased out as Harris has announced that it's End of Life and support will soon stop.

These are the main site frequencies for the new system,

0769.2562
0769.5062
0769.7562
0770.0062
0770.2812
0770.6062
0770.8562
0771.1812
0771.4312
0771.9062
0772.3062
0772.5812
0772.8812
0773.1312
0773.3812
0773.6312

Oh, one last thing. There have been rumors that the new system is going to be encrypted, and if that's true, we're going to be out of luck.

As you have posted to the 536 group I assume you are referring to this radio. But check other radios for the ability to upgrade to Pro Voice that Uniden makes. The "Home Patrol" versions may have this Pro Voice option available to us also. These radios allow the zip codes to be entered. The radios have onboard the data base and will automatically load and scan the zip code area you enter.

EDACS is an open (not intentionally designed to be a private system, but the ProVoice
flavor of it may have been chosen before scanners were manufactured to receive it. Now, the
536 can receive ProVoice but at an additional cost ($50?-the cost of the license you get
from Uniden so you can download their firmware which modifys the scanner for inclusion.
That's it.

I want to thank you all, Joe M, Gary and Bill !!!!!

All of you have been very, very helpful and make great points.

The local news (3 Networks) have all had a series on TV about this situation.

Only one has gotten back to me that I emailed. I was told by that station that they are still investigating this

And have been since 2013 .

Again, Thank You ALL!!!!!

Ray

At that point, I would attend a meeting and ask for a commitment that they will not be encrypted and will remain available for the citizens to monitor. Force their hand to commit that it will not be encrypted and will remain open as the previous systems have been.

If they push back using "we don't know", you can push ahead and state that even if encryption capability is available, it need not be used for routine communications such as dispatch calls and operations. Point out that using encryption or not is a decision they can make today.

In short, nip it in the bud.

It's much easier now than it will be to reverse a bad decision later.

If there is any sort of investigation going on, then no one is going to want to talk about it. If there are questions about how federal money was spent and the federal government is investigating, then definitely no one will want to talk about it.

Joe M, Gary, Bill are anyone else that is willing to help.

I had a friend who just brought to me his BCD996P2 Scanner.

He does not have the City of Mobile programmed into it.

I also have a copy of Butel ARC XT Pro installed on my computer.

I have never programmed a P25 Digital System before in my life.

I tried to Program it myself by using the below frequencies that Gary was nice enough to provide.

0769.2562
0769.5062
0769.7562
0770.0062
0770.2812
0770.6062
0770.8562
0771.1812
0771.4312
0771.9062
0772.3062
0772.5812
0772.8812
0773.1312
0773.3812
0773.6312

I am a dummy and I am lost. Does any have the time to email directly @ bcd536hp1 @ yahoo . com

And tell me how to program this scanner using this butel arc software?????

Any help will greatly be appreciated . When you go to File on the software it shows

(ADD) NEW CONV, NEW TRUNK, NEW REBAND TRUNK, NEW MOTO TRUNK, NEW EDACS TRUNK, AND NEW LT TRUNK.

And from there I am ABSOLUTELY LOST!!!!

4405. Siren app with iPhone/iPad and android

Yahoo group: BCD536HP

From: ve3ctp@...
Topic: 4405 Message: 4405

A friend of mine just purchased a 536. Radio and wifi dongle firmwares are up to date.

The issue is with the siren app. The app will not connect to the scanner using his iPhone and iPad. However on the same network the siren app will work on my Samsung s7.
The app opens on the iphone and iPad and asks for the ip address. The correct ip is entered the app remains open however no scanner information is displayed..in infrastructure mode .

Any suggestions would be appreciated

If this issue has been posted before, please direct me to the thread

Try power cycling the scanner, making sure it gets back on the LAN; NOT connecting the Samsung to it and (after clearing it from the background apps) try Siren again. It's not too hard to scramble the networking on '536 (it won't aggressively reconnect to the network either, if the connection was dropped). It can only 'talk' with one device; the last one connected.

Part of the issue is also the iPhone because of the way it runs apps in the background. You have to actually kill the app sometimes in order for it to connect properly again if it fails.

So I reported this right when the 536 came out, still on the latest firmware it happens. The 536 doesn't always 'remember' the condition it was in when you turn it off then back on. So basically.. Hold on a system, but scan department and channel. Turn off scanner. Turn it back on, and it is scanning all systems... Pretty annoying :(

He said he was scanning TGs and Departments, but holding the System.
I don't have a 536 in front of me and with power to try that.

The closest I can come to duplicating your issue is when I go into the menu, make a change, and then use the SYSTEM button to get out of the menu.

I've been holding on the same system for several days and have turned the radio off and on a number of times.

So just did it twice - once it worked (ie it turned on and 'held' the system) , the second time it didn't.

I don't know if it makes a difference, but I have it connected to my PC, so it turns on, prompts serial storage? then goes by default to serial connection, But it did it without being connected to a PC too...

Current firmware?

Also, you are waiting until power-down until you re-power, right?

As others are not having the issue, it must be something in your unit.

Yep, latest firmware. Powering down generally overnight. It's not happening all the time, I'd say most of the time, so to say that other people tried it once or twice and it's not happening doesn't mean it won't happen... Unless of course others do it all the time too like me :)

Humm Might want to verify that everyone is using the same firmware
version. I'd think you're on the most current but perhaps not.

When you shut down a Systems are you using a QK Number or using the avoid button. If using the avoid button they will come back on on restart. If you want to do it that way, you need to press avoid button twice.

Are you in ID SCAN or ID SEARCH mode? Is
there an active channel when you power down?

Joe M.

From: MCH
Topic: 4412 Message: 4435

OK. What I was thinking is that there could have been activity on an unprogrammed channel, and that confused the scanner. I know if you hold on a channel that is not in memory, it will not hold that on power cycle. But that would require ID SEARCH to hit on one of those.

It's still possible it's the card, but that's all I can think of offhand. I can see how the PC connection might trigger a scan, but you said it does the same thing without the PC connected.

I wonder if the control channel is changing, and when the scanner sees a non-active channel it goes into scan mode.

Joe M.

4437. New Antenna Coax Creates Hum

Yahoo group: BCD536HP
Date: 2017-02-20 18:24:50 UTC
From: Tim Ferguson
Topic: 4437 Message: 4437

We just installed mini-8 cable from our antenna on a 40-foot tower all the way to the BCD536HP in the home office to upgrade and replace an RG-6 that has been spliced too many times. Works much better and reception is greatly improved with one problem.

I have the scanner connected to the audio input on a desktop and connected to the Internet for picking up using a scanner app, which has worked great up until now. Now, we are getting a hum when the antenna is completely connected to the scanner via the computer. Unscrew the PL-259 outer ring and back it off and the hum goes away. Reconnect and snug it up as it should be and it's back.

Any ideas where the problem is? The audio on the scanner itself is perfect when the audio patch cable is taken out, it's something in the connection to the computer. The speaker is cut off when the cable is inserted.

I created a new cable without any change, and am Wondering if it has anything to do with the tower ground maybe, or the ground between the scanner and computer? Both are plugged into the same grounded outlet.

Thanks for any ideas or suggestions,
Tim

Sounds like a ground loop associated with the feedline.
How is your feedline grounded?

RG8 Mini has about twice the loss of RG6, so
your RG6 must have had a bad connection somewhere.

From: bob.peloquin@...
Topic: 4437 Message: 4440

A little more info on ground loops: The antenna, cable, scanner and computer providing the feed are all grounded to different points. This causes a ground loop where slightly different electrical potentials exist on the "ground" connectors of the different devices.

Ideally, the antenna tower, scanner, computer and building electrical ground will all be directly connected to each other with heavy gauge wire (4 to 6 ga) with multiple ground rods at the tower and house grounding locations.

If you cannot easily accomplish this ground-wiring scheme, at least run a heavy ground wire between the antenna mast and the scanner/computer. You may want to isolate the radio and computer grounds from the building's ground at the 3-pole electrical connector on the power cord if you provide a separate chassis ground between all the devices. Usually the network equipment uses wall-wart power supplies and is not electrically grounded. If any has a 3-prong power cord, you'll want to tie the chassis ground to your other grounds and isolate the 3rd prong from the electrical system ground,

With separate ground locations separated by as little as a few feet, a nearby lightning strike could charge the earth and cause high voltages to appear on these different, unconnected, ground locations. This spells disaster for sensitive electronics and can be very dangerous and costly. A good continuous ground conductor between widely spaced grounds can be an inexpensive "insurance policy" for your stuff. Don't ask me how I know...

There's also an impedance mismatch and level is probably too high. Try using the line out from scanner to line in on the computer.

From: <radiotronic@...>
Topic: 4437 Message: 4442

To start with - RG-6 is wayyy better than mini-8 --- but be that as it may, if you are getting better reception, you fixed some of the splice/connector problems in your old co-ax run.

That said - you already answered your problem in stating it. The hum comes when you connect the 'outer ring of the PL-259' --- e.g. when you connect the ground.

This is probably due to a ground loop or even a bad braid connection up at the top, so the braid (outer shell) is acting like a neighborhood RFI pickup antenna).

Put a ground stake in the ground 6-8 feet deep (get em at home depot/lowes/radio shack) , and GROUND the scanner. And verify that the connection at the antenna is solid.

That ought to clean up your buzz. If not, ground your computer as well, but as you said, when you connect the ground of the antenna.

Hi Bob et al,
Apologies but this thread reminded me of a question I had, and I apologize further if this is a simple/stupid question or if it was already answered. Bob, you seem to know a lot about this but I would need a very, very "dumbed-down" version, lol...
I live in a two story house and am interested in installing a discone antenna on the roof. The house currently does not have a lightning rod. In the "old" days, where I grew up, every house had a lightning rod. Are they a thing of the past?!
Does anyone have a good recommendation for grounding a roof-mounted antenna? Does it need to be? I think my primary objective is to protect the house first, and the electronics second (the house being slightly more expensive!). Is mounting a discone on the roof asking for trouble? ;-)
When I was into amateur radio, I ran a ground using a copper rod into the soil with copper wire from the radio to the rod, but I transmitted using an indoor antenna in the attic at the time (and the house had its own lightning rod). I had one outdoor antenna but it was not at the highest point on the house. This all 'seemed' to work fine for many years.
Not sure what the standards/codes/regulations/new science is behind lightning rods and grounding of antennas. My initial idea was to run a separate grounding wire (4-6 ga) along the side of the house from the antenna into a copper rod driven into the soil near the house, and then run the coax separately into the house.
Any other ideas or solutions would be great! I love the 536HP but would like to take listening to the next level.... also have an old Icom IC-735 that I could potentially hook up to a roof-mounted antenna. Just moved from an apartment to a house and am looking forward to getting back into my old hobbies.
Thanks,-Chris (KB2HDP)
(again apologies for the dumb question)

Thank you for taking the time to go into such great and understandable detail, that helps tremendously. I'm basically self-taught with the help of different electrical gurus like yourself and others on this list and friends over the past 40+ years, having had my first Bearcat scanner when I was in high school back in the early 70's when you had to have crystals. Actually began with a Western Auto AM/FM/Hi/Lo 4-band tunable radio that I could pick up the local PD on 39.5. Not sure how many 9-lives I've gone through, but probably several over the years.....☐.

So, can I start by grounding the tower and grounding the coax where it enters the house, both with high quality grounding rods and 4-6 ga. wire?

My scanner is "Centralia Area Fire & EMS" under Marion County, Illinois. One of the people that recommended the mini-8 cable operated the scanners at "Centralia Police/Fire......etc." also under Marion County, Illinois. He seems to have much better reception and quality of audio than I do as well. He has two separate scanners connected, one on the left channel and one on the right.

Thanks, once again,
Tim

So, I assume that using a Radio Shack ground loop isolator would not be the proper path to take, but actually making sure the house, antenna, tower, etc., are all grounded properly to avoid further, more serious problems?

For starters, this would included making sure the tower is grounded properly, and inserting a ground in the coax from the antenna to the scanner where it enters the house?

I am still using the RG-6 coax, as it is connected to an older Lo/Hi/UHF antenna and to my BCT-15X.

Thank you all, again, and my apologies for not posting this prior to running the cable, etc., so that it would have been done properly.
Tim

Why not? Other than what Joe mentioned about it having twice the loss as RG6. It was recommended by several. That's the first I've heard, by the way, of it not being more suitable than RG6 which is better for cable TV, etc.

I would also not forget to add lightning protection.

Like many things, that can range from
the cheap to the ridiculously expensive.

On the side of the "expensive", I recommend Polyphaser. Of course,
with proper surge suppression comes the need for proper grounding.

Just a slight addendum on my earlier post. If you are using the line for transmitting, being 50 ohm line will matter (hence use 8X/8 Mini). For reception-only, the fact RG6 is 75 ohm cable (typically used on satellite and cable TV) will be of little significance. Many antennas are not 50 ohm either. In fact some come with adapters to convert to 75 ohm cable.

And when it comes down to it a 50 ohm match to a 75 ohm is only a SWR of 1: 1.5

4451. RE: [BCD536HP] Re: New Antenna Coax Creates Hum

Yahoo group: BCD536HP
Date: 2017-02-21 01:40:06 UTC
From: <radiotronic@...>
Topic: 4437 Message: 4451

I'll tell you what I CURRENTLY have .. I live in central Florida and have been hit by lightening on two times :)

But this is what seems to work.

I have a 50 foot push up mast (radioshack/home depot) and on the top section where it meets the second, I put a cross bar and on each end of that a show vertical mast.

SO – if you can imagine that | | |

|

|

And I put 3 discones up – one on each vertical pole – the main one, and the two short ones on each end of the cross piece.

I bring the coax-s down to the shack and run them through lightning arresters which are each grounded to a copper plate I bolted on the wall, with a huge copper wire going out the window.

At the bottom of the 50 foot mast, I put an 8 foot ground rod into the earth and connected the 50 foot mast to it with giant braid, and also connected the wire from the copper plate to the ground rod.

(do I have 3 scanners?? No – I have 9 -- -I run each to a amplified splitter)

I haven't had any problems. The second lightning strike did NOT hit the discones and the scanners were fine (the computers in the house were not, my NAS wasn.t, etc).

But the grounding is ok.

I use the old ICOM 7000 discones and one of the new 8000 – (Diamond is just as good) – these are GROUNDED antennas – e.g. they are a short from the center pin to the outer. So now differential charge accumulates.

Some other manufacture doesn't do this and my first lightning strike put aluminum flakes 4 or 5 houses around where it used to be.

Don't use a floating antenna.

It is also a pain but good practice to connect your antennas to your radios only when you are using them, and leaving them disconnected when not – minimize the strike potential even more.

But – lightning will do what it wants, when it wants. So all we can do is what we can and hope for the best.

R

Hi Bob et al,

Apologies but this thread reminded me of a question I had, and I apologize further if this is a simple/stupid question or if it was already answered. Bob, you seem to know a lot about this but I would need a very, very "dumbed-down" version, lol...

I live in a two story house and am interested in installing a discone antenna on the roof. The house currently does not have a lightning rod. In the "old" days, where I grew up, every house had a lightning rod. Are they a thing of the past?!

Does anyone have a good recommendation for grounding a roof-mounted antenna? Does it need to be? I think my primary objective is to protect the house first, and the electronics second (the house being slightly more expensive!). Is mounting a discone on the roof asking for trouble? ;-)

When I was into amateur radio, I ran a ground using a copper rod into the soil with copper wire from the radio to the rod, but I transmitted using an indoor antenna in the attic at the time (and the house had its own lightning rod). I had one outdoor antenna but it was not at the highest point on the house. This all 'seemed' to work fine for many years.

Not sure what the standards/codes/regulations/new science is behind lightning rods and grounding of antennas. My initial idea was to run a separate grounding wire (4-6 ga) along the side of the house from the antenna into a copper rod driven into the soil near the house, and then run the coax separately into the house.

Any other ideas or solutions would be great! I love the 536HP but would like to take listening to the next level.... also have an old Icom IC-735 that I could potentially hook up to a roof-mounted antenna. Just moved from an apartment to a house and am looking forward to getting back into my old hobbies.

Thanks,

-Chris (KB2HDP)

(again apologies for the dumb question)

Subject: [BCD536HP] Re: New Antenna Coax Creates Hum

A little more info on ground loops: The antenna, cable, scanner and computer providing the feed are all grounded to different points. This causes a ground loop where slightly different electrical potentials exist on the "ground" connectors of the different devices.

Ideally, the antenna tower, scanner, computer and building electrical ground will all be directly connected to each other with heavy gauge wire (4 to 6 ga) with multiple ground rods at the tower and house grounding locations.

If you cannot easily accomplish this ground-wiring scheme, at least run a heavy ground wire between the antenna mast and the scanner/computer. You may want to isolate the radio and computer grounds from the building's ground at the 3-pole electrical connector on the power cord if you provide a separate chassis ground between all the devices. Usually the network equipment uses wall-wart power supplies and is not electrically grounded. If any has a 3-prong power cord, you'll want to tie the chassis ground to your other grounds and isolate the 3rd prong from the electrical system ground,

With separate ground locations separated by as little as a few feet, a nearby lightning strike could charge the earth and cause high voltages to appear on these different, unconnected, ground locations. This spells disaster for sensitive electronics and can be very dangerous and costly. A good continuous ground conductor between widely spaced grounds can be an inexpensive "insurance policy" for your stuff. Don't ask me how I know...

In my rambling response, I mentioned lightning arrestors. And use the expensive ones I use are the Polyphaser ones - only ones I trust.

I would also not forget to add lightning protection.

Like many things, that can range from
the cheap to the ridiculously expensive.

On the side of the "expensive", I recommend Polyphaser. Of course, with proper surge suppression comes the need for proper grounding.

The ground-loop isolator will get rid of the hum but will do nothing for your grounding problem. I had to use a ground loop isolation transformer when I ran a feed for Broadcastify too. The issue is that the scanner's external speaker output has a non-grounded jack where the negative side of the signal (attached to the longer sleeve part of the plug) is not tied to chassis ground. This means that the internal amplifier is not referencing ground and you should not connect two grounded devices together using the external speaker jack.

A 1:1 audio isolation transformer will do the trick nicely. Sorry if I forgot about this issue in my previous post about grounding.

As for grounding - the MOST IMPORTANT part is that multiple ground rods must be connected together by heavy wire. That means you must have a heavy ground wire between your tower ground rods, scanner ground rod and the main electrical system ground rod(s). Not doing this will reduce your grounding system's ability to sink lightning to ground and can produce several thousand volts potential difference between devices using different ground references.

As for grounding your antenna itself - meh... I run my discone grounded only at the radio and mounted on a piece of plastic conduit. Is it safer or more dangerous? Hard to say. My roof looks like a NASA tracking station with all the antennas. One of them being ungrounded probably won't make any difference.

FWIW- Per NEC - any grounding requires bonding to the existing ground rod. In essence, one central ground. I know a lot of people ground antennas separate, I used to as well. Good friend and Ham several years ago worked for Time Warner. At the time he was charges with pulling existing cable ground rods and grounding back to house ground, His service vehicle had hundreds of old rods in it.
NEC also requires 2 or more ground rods per dwelling. All bonded together.

A Radio Shack ground loop isolator (Catalog #: 2700054) has solved the hum issue, but questions remain on making sure everything is grounded properly.

The fact that both the scanner and computer are plugged into a grounded outlet doesn't mean they are grounded to the same ground or each other?

Since the scanner uses a 2-prong wall-wart for power, then it is NOT grounded. You need a ground wire attached to the scanner's chassis and connect that to the building ground.

And half the houses here in south florida were built pre 3 ground plug standards and still are 2 prong plugs. When I first got my general class license in 1975, I plugged in my xmitter in one socket, and my receiver in another. When I hit transmit, I found 30 volts difference between the metal chassis ‘grounds’ . Never assume anything when it comes to electricity.

Today’s code wiring has each outlet with three prongs – two of them are ‘grounds’. The GREEN ‘ground’ is supposed to be a solid copper wire that ties back at the breaker box. The ‘white’ return (or ground,, you will measure 120 volts from black to white, and black to green) doesn’t have to run to the breaker box directly.

In either case, neither one should ever be considered ‘RF’ ground – they are AC power ground only – that is why we keep saying, pound in those copper stakes.

THOSE are RFI and lightning grounds.

The fact that they are both plugged in means that yes, you have squirrely ground loops – but that is ok for AC BLACK. And it should catch up to the green ground.

R

So would an outlet tester from Lowes, etc., be sufficient to test outlets for proper grounding? Or is there something better a homeowner might be able to use and have on-hand?

When we bricked the house last summer, the electric service was moved and updated, including proper grounding, according to Ameren Illinois standards/recommendations with Ameren running a new line from pole to house.

From: Ray
Topic: 4461 Message: 4461

Hello group.

Before I buy this 536 scanner I have a few questions.

I know I want to buy the upgrade to the Pro-Voice as well.

My questions are, What are the advantages of upgrading to DMR?

Should I pay to have it programmed or as it as simple as I have read that all you have to do is put in your zip code.

And when putting in your zip code in does that cover every radio system in that county and or city and how does that work?

And let's say I wanted to program another county into it as well, how does that work?

I know this is a base model but I have a hunting camp in a different county already set up with the discone antenna and all.

Thanks

Ray

The whole HomePatrol family including the HP1, HP2 and 436/536hp have every known (to RadioReference.com) frequency in the US and Canada already in them so there's no "programming" per-se. You only need a zip code or latitude/longitude to begin receiving everything within range.

However, that being said, it only knows what RadioReference knows. You may still need to create a separate favorites list with extra stuff that's not in the database. As for DMR - depends on what systems in your area use it and whether you want to hear them or not. Hams are using it quite a bit. We have several ambulance services and towing services using DMR here in Massachusetts but it's mostly boring stuff. ProVoice is only used by a very few remaining EDACS trunked radio systems and is no longer officially supported by Harris anymore so will eventually go away. If what you want to listen to is ProVoice then get it. If not, then don't.

All the location-based scanners have similar features and limitations. The 536hp is a great scanner but can have a daunting learning curve. It's not your old 10 channel crystal scanner...

Yes the ones with the 3 lights are typical for a homeowner to check for basic wiring errors.

As others have mentioned external antennas (TV, scanner, etc) should have their own lightning protection devices installed and connected to proper grounding. Multiple ground rods (service entrance, cable, telco,outside antennas) should all be connected together typically with #2 solid copper wire. In communication sites grounding there are requirements that the grounding system meet specific ground resistance measurements and specific directions for connections to the grounding system.

If you are interested try a google search with the term "radio site grounding".

By "should all be connected together", do you mean physically or via a common earth ground? The coax from my scanner's antenna on the tower enters the house at the opposite end of the house from the tower, cable, phone, service, etc.

By "should all be connected together", do you mean physically or via a common earth ground? The coax from my scanner's antenna on the tower enters the house at the opposite end of the house from the tower, cable, phone, service, etc.

Tim

On Feb 22, 2017, at 9:27 AM, Milton Engle mengle@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

Yes the ones with the 3 lights are typical for a homeowner to check for basic wiring errors.

As others have mentioned external antennas (TV, scanner, etc) should have their own lightning protection devices installed and connected to proper grounding. Multiple ground rods (service entrance, cable, telco,outside antennas) should all be connected together typically with #2 solid copper wire. In communication sites grounding there are requirements that the grounding system meet specific ground resistance measurements and specific directions for connections to the grounding system.

If you are interested try a google search with the term "radio site grounding".

4467. Unknown issue

Yahoo group: BCD536HP
Date: 2017-03-01 05:21:56 UTC
From: Howie Seiden
Topic: 4467 Message: 4467

Hi group. Have a problem that I would like to get some feedback back on.2 days ago I reconnected the WiFi Dingle and the first weird thing I noticed is that this restored my clock as I have not sent it in yet. Shortly after the Siren app locked up. I finally had to restart the phone to get it off. I then noticed the scanner also seemed to have frozen status on display. I turned the power off to the scanner but the unit remained powered up. After 2 minutes I turned it back on. It started scanning again and never shut down. A check of settings shows the file size at zero. A short time later I shut it down and noticed it did not write to scanner like it used to do. As I turn it on it boots up as normal and downloads all favorite lists from SD card as normal but every time I turn it off it does not write to scanner.
Any ideas what may be the problem and any suggestions?

I'm not sure how the clock figures in, but maybe the card got corrupted
and set to READ ONLY.

How do you figure the clock issue was solved? (what are the symptoms you
noticed?)

The clock just resets every time the Android phone is connected via the Siren app as I tried it a 2nd time.I will try swapping out cards to see if that will fix the issue of not writing to the SD card on shutdown. The strange thing Joe is in settings it doesn't read the file size but it has no issues writing to the scanner on startup.

Wow, too many conditions... trying to correct one at a time may work, you get lucky and the first fix fixes all. Or, A factory reset? A firmware overwrite?

I'd be inclined to put the radio back in the condition it shipped to you in, and using your backed up favorites lists, rebuild. I'd also format or replace the SD Card.

But that's just me. I'm interested in reading replies as they are posted that help you correct the issue(s). And if applicable, posting in the files section, solutions.

From: Howie Seiden
Topic: 4467 Message: 4472

OK I tried a new card. In settings the file size still shows 0 percent used. I in the NYC Metro area so my favorite list is extensive. Broken down by counties in NY and NJ so I would think it would be bigger than 0.
On start up it boots up fine. The card downloads to the scanner. When I shut down. The scanner does not write to the SD Card. It just goes sudden dark.I have not connected the dongle yet with the new SD card. The WiFi mode was when I first had strange behavior on the old card. Scanner locked up. Hit buttons with no response shut off power and scanner kept going and stopped writing to SD card. Could a virus have gotten in thru the WiFi?
Scanner is working for now and I can live without the Siren for now.
Also thinking maybe try a firmware update and both the scanner and dongle but that will have to wait until Thursday.
Any thoughts greatly appreciated

Howie

4475. SLEEPY 536HP

Yahoo group: BCD536HP
Date: 2017-03-12 14:18:35 UTC
From: kc0sbl
Topic: 4475 Message: 4475

I know that it sounds strange but my trusty 536HP does not like to wake up. When I turn it on it receives analog transmissions immediately and properly. However it will not receive any digital (P25) transmissions for an extremely long time - usually as long as 2 or 3 hours or more. Once it receives even one digital transmission it then runs normally. The display shows it scanning normally, the TGs etc are set to my normal channels and those channels have heavy traffic, eg. Minneapolis Police & Fire. I do nothing and change nothing - eventually it catches 1 P25 transmission then it receives everything constantly and well until it gets turned off - then the issue starts all over again.
Any suggestions welcome!

Don't turn it off? Just turn it down and darken the display. Mine never get turned off, but they do get programming updates from time to time.

Check the threshold values, make sure they're not unexpected levels.

Rick

I would submit that only those posting here are having issues. It is a very slanted view. Why write if things are working as designed?

It's a very small percentage of all that are sold and in most cases it's a user problem, not a scanner problem (SD cards being an exception).

The SOLE exception is the Siren app (NO do NOT restart that whine) for the Android users (there IS a program that works). It never appeared and the IOS version could use some fixes.

So don't be a troll, consider that happy users don't have a need to write here.

I have two BCD536HP and on BCD436HP and they've been flawless, perfect. But I also took the time to understand them (a learning curve), I'm technically capable and I've been doing this for a very long time. It's not your grandpa's scanner.

I feel like I had the same experience sometimes. My solution is to let it scan and then in mid scan hit the hold button. If the hold button caught on a P25 entry it seemed to wake it up.

> On Mar 12, 2017, at 10:18 AM, kc0sbl kc0sbl@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:
>
> I know that it sounds strange but my trusty 536HP does not like to wake up. When I turn it on it receives analog transmissions immediately and properly. However it will not receive any digital (P25) transmissions for an extremely long time - usually as long as 2 or 3 hours or more. Once it receives even one digital transmission it then runs normally. The display shows it scanning normally, the TGs etc are set to my normal channels and those channels have heavy traffic, eg. Minneapolis Police & Fire. I do nothing and change nothing - eventually it catches 1 P25 transmission then it receives everything constantly and well until it gets turned off - then the issue starts all over again.

I’m one of those who has had no problems with mine. No “clock” issues, nothing. It works like it should. Every now and then, for reasons unknown to me, it’s not receiving something even though I know the programming is good. So, I think it’s a card issue and I just reformat and reinstall and we’re good.

Rick,

Agree with your post. Almost... While flawless is not the word I would use, if you had included "For the most part", I would have agreed. Thanks for responding to a post that first insults and then pleads, begs for help. You posted in a manner that defuses additional tirades by simply ignoring the expletive stuff that comes with the frustrations of the learning curve and an unrealized, unrealistic promise.

While I have a problem with Uniden's original Wi-Fi claims, they were having the same problem trying to understand and correct it also. I like to think they were blind-sided by it and did everything humanly possible to make good on it. And they fell short but salvaged what they could.

But overall, the BCDx36HP is one fantastic scanner. It continues to amaze me years after its release.

Thanks for getting your reply out to the group in such a quick fashion. Hopefully it will keep the rehashing to a minimum.

Bill

Mark,

I discovered during the original HP1 days that reformatting the card takes care of most reception issues. Probably something we will always deal with as I believe it's caused by a couple things. One, write speed. The faster the cards the less the issues. Second, garbage. Yes, garbage. Each time there is a transmission it's stored for whatever you have the replay set up for. Sure, it erases the data, but it isn't.So at some point the clutter catches up with

Don't turn it off, just turn the volume down.
As for what is causing it, no clue, however I would try reformatting the card and reinstall the files. Make sure to save them to your hard drive in a separate folder.
Use SDFormat from sdformat.org I think it is. Format using fat32 I believe.

Okay, flawless was a slight exaggeration. The 436 had both the clock and display darkening; one of the 536 had the darkening. Both fixed at no cost (other than one way shipping, trivial) and name one product that NEVER had growing pains from using an outside supplier (parts, wifi dongle)... That list is non-existant. Customer service was excellent. I've also added the DMR to all of them which got ME into using DMR as well for ham radio.

Overall, I'm VERY happy with this collection (after a learning curve, duh). The one feature I adore, is that when I hook one up to a GPS* while I drive; it programs itself as I transit different areas according to the things I want to hear (familiar happy noise and traffic alerts for any rerouting I might have to do). I don't have to interact as I move through states/counties, it just works.

Now if we could just convince the database that US weather is NOT a useful part of "Federal" in selecting, it would eliminate a bunch of lockouts for that GPS loading. That's a minor complaint.

FWIW department: The 436 rides in the car/cab with me hooked into the sound system; one 536 stays at home (I can listen remotely if desired) and the other 536 is for the RV but also used at home. My really ancient and decrepit R/S Pro-2004 still plugs away downstairs since I don't require trunking to hear the local FD/LE (since narrow banding, turn it up). I sold my (still useful) GRE (R/S) scanner and it's now living in Hawaii for the P25 network there.

Rick wa6nhc

* I take the GPS output of the Kenwood TM-D710a (Green Light Labs GPS, secondary port) and attach that to the scanner. All good but a mess of wires in view; function before form. It works.

I'm also doing much the same with my 3. A 536 is at home and goes portable when I attend Airshows in a pack I made with a Lithium-Ion motorcycle battery and an amplified speaker. The other 536 resides in my truck and the 436 is usually right there with me for portable use when away from the other two.

I am presently on a trip to Daytona Beach Fl for their motorcycle Bike Week. The Harley Davidson is on the Pickup truck and the 536 is doing the GPS thing all the way from Connecticut! The systems I hear need tweaking... data channels and such need to be avoided but the trip home should be better. I'm currently just north of Richmond Va. and resume my trip on I-95 south early tomorrow. I take my time and do it in 3 days which allows time to plug in some zip codes at the motels I stay at and copy the local traffic. What I'd really like is to find some trucker who drives the I-95 corridor with a x36 and has a Favorites List already compiled and fine tuned! If you have any info or ideas on this (like finding a yahoo truckers group) please let me know.

Good talk

Bill

You laugh... but what you say is the truth, a gross exaggeration of the truth but when you look at the accident stats you will find alcohol or other impairments listed as a causation factor in much higher percentages. Duh! You drive by the local tavern and see the bikes lined up... tell me they are all drinking root beer! My bike may be parked there with others but I've got a rule... two wheels, two beers. If I want to hang around and drink I'm drinking a water in between and allowing one hour for each drink I might have. I can drink 5 beers in an hour but must wait 5 hours before I get on the bike. Needless to say, with restrictions like this I don't do a lot of booze guzzling. My buddy told me the if the amount of wheels determines how many beers I can have I should have become a tractor trailer driver! 18 beers! That works... cause ya can't pull yourself up into the cab, that is if you can even find it!

The one feature I adore, is that when I hook one up to a GPS* while I drive; it programs itself as I transit different areas according to the things I want to hear (familiar happy noise and traffic alerts for any rerouting I might have to do). I don't have to interact as I move through states/counties, it just works.
> Now if we could just convince the database that US weather is NOT a useful part of "Federal" in selecting, it would eliminate a bunch of lockouts for that GPS loading. That's a minor complaint.
>
> FWIW department: The 436 rides in the car/cab with me hooked into the sound system; one 536 stays at home (I can listen remotely if desired) and the other 536 is for the RV but also used at home. My really ancient and decrepit R/S Pro-2004 still plugs away downstairs since I don't require trunking to hear the local FD/LE (since narrow banding, turn it up). I sold my (still useful) GRE (R/S) scanner and it's now living in Hawaii for the P25 network there.

Now well OT, so I'll close with:

I'm all too WELL aware of the results of poor decisions regarding the consumption of intoxicants (here in CA, it's not always alcohol). I spent a career cleaning up the 'mistakes' of those partaking. It gave me a very strong and negative view of those who *choose* to commit driving while under the influence (including marijuana, soon to be legal in CA because booze has worked out SO WELL for everyone). My stated views on the matter are on public record but lets just say there is a (harshly permanent) cure for repeat offenders and society would be much better behaved; it just isn't a popular view.

In my own unscientific study of all the wrecks over the decades that I attended to, almost 80% involved an intoxicant; another ~7% was fatigue. About 5% was distracted (road turned, driver didn't but they had TUNES!) and a couple percent were mechanical failure (being generous since most of that was already known but they drove anyway). That leaves only a couple points for weather (driver error) and a trace for 'accidents'. About half a percent was left filed as "SHtuff happens", just weird crap people tend to get into. I lost count of the number of wrecks, easily thousands.

Sometimes karma was immediate (coroner), sometimes it took a while (conviction if luckier) and occasionally I got to watch it happen. Payback is a beeyotch and sometimes, it made my week. If I could connect the intoxicated party as the driver and show they were incapacitated from chemicals; I'd giggle as I got to watch them get hooked and booked. That was good for a month of happy thoughts, one less on the road, for now. Book 'em Officer/Deputy. ;-)

And THAT is why a scanner is a familiar happy noise, I've heard it for decades at work and in wanting to be aware of things around me. Most folks live in a fog, never knowing what's going on around them. Sometimes, I envy them.

And no, I don't imbibe. If I'm going to do something stupid, I usually don't need that kind of help.

We can let this thread die off now since it ranged so far OT.

Thanks - I have done all the re-formatting tasks but it has made no difference. Today the 536 has been running non-stop for 8 hours. It is regularly receiving analog transmissions but nothing digital.

Tonight I will try the suggestion of just dimming the screen and minimizing the volume and see it has fixed itself by morning.

Don't turn it off, just turn the volume down.
As for what is causing it, no clue, however I would try reformatting the card and reinstall the files. Make sure to save them to your hard drive in a separate folder.
Use SDFormat from sdformat.org I think it is. Format using fat32 I believe.

Hey back,I am going to also reformat the SD card,I know all the updates are done,updated version on Sentinel. I do get Analog channels with no problems.I used to get the P25 trunking channels before as I remember the PT0,PT1,PT2,P25,I believe showed up at one time,but seemed to disappear. I see now I got a P25 District 13 Lowell come through just now,but seems that is all I get???Going to reset my settings at try that,in case I may have hit something wrong first,then reformat,then reload my Favorites,after going through them again fresh,clean the screen and start over.Something just ain't right,either it is me or the scanner is going goofy??I was able to get siren working,but still nothing with trunking,just the one I just saw 2 minutes ago,Lowell District 13,which they run I65 pulling over cars and semis,this comes up over the Indiana Project Hoosier State Police Region 1,so I know that this system is trying to work.I also just seen District 14,with I believe this may be St. Joseph County.I will play around this afternoon,lots to do this morning with my son,but keep you up to date,thanks for the reply,we shall get these going,I hope soon,miss my local Police and Fire,as I do pick up the analog fire and ambulance calls on I think it is 154.8150,if have read it correctly.Talk to you all soon,fingers crossed.Have a great weekend,will keep in touch,let me know if you had any luck or ideas??Mark

One more thing to consider is if the system you want to hear, has had any changes (encryption?), upgrades or improvements (more sites, different control channels). In short, your fave list may no longer be valid. Many systems are dynamic; they grow, add agencies, departments and coverage.

As a test, create a new one (rather than modifying your old one) and upload that to see what happens. If it works, move the remainder of your old fave list into the new one.

You might also play with the digital threshold levels (don't recall the proper name ATM).

Thanks for the ideas, Rick, but I don't think these are the problems. If either the favs or the thresholds were the issue I would think that the problem would be permanent, not transitory. The scanner will eventually catch and translate the P25 channels in the same old favs lists with the same old settings - it is just that it takes many hours, usually all night long, before it catches a P25 transmission. Then it will work fine on all my P25 favs. Many hours of silence then constant success until it is turned off again. So far the only thing that works is just leaving it turned on 24/7.

This sounds like it could be control channel related. Is it possible that your scanner is locking onto a tower that routinely carries very little traffic outside of the one department you are hearing?

Dewey

Date: 2017-03-19 12:58:06 UTC
From: jimstein343@...
Topic: 4475 Message: 4498

Thanks for the idea, Dewey. I don't think it is the control channel. The scanner is not locked onto anything. I can see it continuing to scroll properly and it is not grabbing any P25 frequency at all - until it finally catches one. When it releases that one it will catch all of the programmed P25s normally. ----- Original Message ----- From: "Dewey3 Dewey3@... [BCD536HP]" To: BCD536HP@yahoogroups.com Sent: Sunday, March 19, 2017 5:52:10 AM Subject: Re: [BCD536HP] SLEEPY 536HP This sounds like it could be control channel related. Is it possible that your scanner is locking onto a tower that routinely carries very little traffic outside of the one department you are hearing? Dewey On Mar 19, 2017 00:06, " jimstein343@... [BCD536HP]" < BCD536HP@yahoogroups.com > wrote: Thanks for the ideas, Rick, but I don't think these are the problems. If either the favs or the thresholds were the issue I would think that the problem would be permanent, not transitory. The scanner will eventually catch and translate the P25 channels in the same old favs lists with the same old settings - it is just that it takes many hours, usually all night long, before it catches a P25 transmission. Then it will work fine on all my P25 favs. Many hours of silence then constant success until it is turned off again. So far the only thing that works is just leaving it turned on 24/7. From: "Rick WA6NHC wa6nhc@... [BCD536HP]" < BCD536HP@yahoogroups.com > To: BCD536HP@yahoogroups.com Sent: Saturday, March 18, 2017 3:09:03 PM Subject: Re: [BCD536HP] SLEEPY 536HP One more thing to consider is if the system you want to hear, has had any changes (encryption?), upgrades or improvements (more sites, different control channels). You won't see the channel it uses, until it locks on a decoded stream
and then only if you show ALL the information on the display. You might
see the virtual channel, I never really bothered to find out. The
channel search is all in the background during scanning; it scans, sees
a signal, decodes to test for wanted TG, then moves on.

Control channels DO change according to local needs; which is why I
suggested creating a new (from an updated database) fave list to test
out. Presuming that the database info is valid, it gives you the best
chance(s) of finding the control site(s).

Systems are dynamic until matured, they grow, they adjust, add sites
during growth, drop sites as others become more capable. Most systems
are never matured as agencies, departments always want more.

You may well have an issue with the scanner(s), but you should also do
the testing to narrow down the parameters. Perhaps even figuring out
how to reinstall the latest firmware.

4500. Priority Use

Yahoo group: BCD536HP
Date: 2017-03-19 23:15:37 UTC
From: Tim Ferguson
Topic: 4500 Message: 4500

I've marked two local fire channels with Priority On in Sentinel which are in my Favorites List 1 & 2. With Priority turned on, these two channels are checked every couple of seconds for traffic which interrupts whatever traffic is happening. But, if one of the two becomes active, you hear it which is what I want, so what's the big deal? Is there a not a way around the interruption on the 436 or 536? And also, just what does Priority DND do?

Thanks!
Tim

4501. Re: [BCD536HP] Priority Use

There is no way to know activity on a frequency without tuning to it, as the x36 only has one tuner. Hence the gaps.

Priority DND will prioritize those channels while scanning (checking them more often), but will not switch to them while receiving a transmission on another frequency.

Thank you, Joe. Had the same issue with more than one older scanner and guess I was hoping the 436 & 536 might have overcome it somehow. Can extend out the number of seconds between "checks", though.

4503. BCD536HP Repair

Yahoo group: BCD536HP
Date: 2017-03-23 05:28:33 UTC
From: k5ykg@...
Topic: 4503 Message: 4503

(I hope I'm doing this correctly!) I experienced the clock and display anomalies so I read up and followed Uniden's instructions for returning the unit and sent it off. One week and one day it was back in my shack working perfectly and all at no charge. Thanks to Uniden for outstanding customer service all at no charge even though the scanner was three years old. Thanks guys for excellent workmanship and heartfelt integrity not often found these days!

Austin Boyd Prestwood, K5YKG

OK,I reformatted the SD card,wiped out all of my favorites on Sentinel,basically started all over. Erased all the data to get the card going,re issued the updates on the SD card. Then went through my favorites,like the Lake County public safety,Indiana Project Hoosier as I selected what I wanted and avoided want I did not want,Indiana Project Hoosier SAFE-T (P-25) and selected what I wanted and avoided the rest and made sure I had my Analog Frequencies from under LAKE,from the County Systems.Make sure all are turned on when you do the Edit Profile and make sure you tap the Blue Floppy Disk,3rd from the left,center row,,on left side of screen. Now make sure on your Location Control under Options,under the Edit Favorites List,(the yellow star with the pencil).make sure it is set to NO.
Make sure your Range is set to 0 also,and check your SER,make sure your listening services are on.
I set my ZIP/POSTAL to my Zip code,but leave it at 0.0.
I set everything,let the scanner go,and after a short,I did receive P25 channels,and some PT0 channels.No right away,a short time later,but I basically re did everything,and made sure I had the updated Version of Centinel,and the SD card was up to date. I hope you understand my mumbling on what I did,but I am getting P25 channels. Possibly you can start all over again,go from there and keep your fingers crossed.So far I am receiving digital channels,NOT MANY OF THEM,so some.Good luck my friend,Mark.Sorry for the long re turn writing,just been to busy around here try to fix my dads 1978 Mercury Grand Marquis.Any one know how to set the cold--High Idle on a Motorcraft 2150,I am lost,even with the directions,,I started on cars with fuel injection,not much on carburetor adjustments,but I did rebuild it,Mark,,,,PEACE to all..

4505. BCD536HP Repair & Return

Yahoo group: BCD536HP
Date: 2017-03-23 06:03:29 UTC
From: Boyd Prestwood K5YKG
Topic: 4505 Message: 4505

Hope I did this right this time!

Just wanted to everyone to know that Uniden's customer service and repair shop rates at the top of my list for efficiency, technical competence and integrity. I was experiencing the clock and display anomalies plus some audio "clipping" that I could not program away so I followed their instructions to return the unit and sent it off. One week and one day later, it was back in my shack in excellent condition and working perfectly as expected. The one week and one day included shipping each way. My unit was three years old and obviously out-of-warranty but the invoice showed no charges. Fantastic! Now, I need to learn more about digital trunking and what goes on in my county! Thanks Uniden.

Agreed! Sent both my 436 and 536 in for the various issues discussed here. Both have been returned and put back into service and are working flawlessly!

Thanks Uniden for the great customer support!

Jim

Hello,one question,did you purchase the scanner straight from Uniden,or from a out source reputable company? Probably doesn't matter,but what gets me is these scanners are made in Vietnam,which kinda blew me away,figured most of these were made in japan,or maybe China? I am still noticing that this doesn't pick up any of my local Police and Fire that are on the P25,I was able to get them on my old scanner when they were Phase 1,now even on this scanner,no nothing on Phase II on the local area departments,only the analog,but those seem to only catch half of the communication from the police car to the base of the department. Honestly,I am not please with this scanner,like with your problem,Phase I worked fantastic,Phase II with this,Project 25 Phase II, APCO-25 Common Air Interface Exclusive,and then reading this foot note,Some talkgroups on this system are using Project 25 Phase II TDMA modulation.
Never had any issues with Phase I,Phase II,nothing works,some things do,but what I want does not come through??????I do not think I need the Pro Voice as I have been reading,there are some frequencies,here is the page to look,,http://www.digitalfrequencysearch.com/ ,DMR,P25,NXDN,just add your county,and state,and there are lists for either one of these.I have noticed a few,but I do not think this would add anything for my area to listen to,as I am not sure why all of my Phase II talk groups,or what ever,does not come in?Talk soon,good luck,anything will help.I may be thinking about selling this and try a Whistler,but want to watch a few You tube videos first???????Talk soon my friend and all,Mark

4509. Configuring / Programming

I have everything in the radio that I want to be there, all downloaded from the Sentinel database.

I've been reading comments about analog freqs, digital freqs, trunking systems and talk groups, etc. And I understand MOST of that stuff. My question, here, is:

Since there are no specific defined "channels", per se, as there used to be in the old analog-only scanners, is there a special way that my frequencies need to be loaded? Or just the download from Sentinel is enough, wherever and however Sentinel puts them? Let me rephrase. Do the analog and digital frequencies need to be "separated" so that they scan "properly" (e.g., FASTER?)?

I suppose the reason I'm asking is that I noticed that the radio seems to scan through certain frequencies very slowly for such a top-of-the-line state-of-the-art scanner. It seems to move in slow "steps" when going through the digital trunked systems. Or is that normal? The radio is supposed to have a scan rate of 80 channels per second. For what I have in there, to scan everything shouldn't take more than 10 seconds, but it seems that it's much, much slower than that.

Also, I have the GPS thingy installed in the car. I'm unsure as to how the channels should be configured in terms of "location control", etc.

I'm no "newbie" to s scanning, but pardon me for the "newbie"-sounding questions.

No - P25 (Phases I and II) comes standard.

Your learning curve needs a little tweak.

P25 is a format
DMR (MotoTrbo, TDMA) is another
ProVoice is yet another

P25 comes stock, ProVoice and DMR are "add-ons" for $50 each, one time fee.

Adding to what Kb6kgx writes about the scanning rate of digital and /or trunked systems compared to conventional... I was informed that the trunked systems that allow "Control Channel Only" are automatically defaulted to that method of scanning. That's the only way the CC capable systems are scanned. And it's by design. If that's the case, and less frequencies are used in the process, why is the rate seeming to suffer? I guess you can't even program a CC capable system without using the CC Only option for comparison. It's just not an option. So that's why there is no choice offered when it comes to CC Only. But I'm not going to press the issue as I have faith in the design aspects. I have faith that Uniden wouldn't have designed it that way without weighing the consequences. (It would be nice if Uniden made public its reasoning behind some of their choices however. Ex; Ok, it seems slower... why is this?).

My two 536's and one 436 have been operating since the first year they were released (with the corrective clock and display repair). And I expect many years of service before one of three things happen, massive encryption which kills the hobby, a newer model is introduced, or I die!

Trunked systems are not "scanned' in the same way that conventional channels are scanned. For a trunked system, the scanner goes to the control channel and decodes the stream for about 1-2 seconds, checking each channel grant and channel update against the channels you have programmed. You cannot speed this up. The data rate coming from the control channel is the limiting factor. If you have multiple sites enabled, it does the above for each site. It takes the same amount of time to scan a trunked system programmed with 1000 channels as it does to scan a trunked system programmed with 1 channel.

Hello,I sent my scanner in,under warranty,and there was a fix under the warranty for something to do with the clock.I am not sure where my receipt is,but I believe there is problems with the clocks,and they repaired it for me without even saying anything or noticing anything wrong with the clock.
I have to agree with you,they do have a fantastic customer service,they even respond to your e-mails when I did have a issue with the scanner.I believe I can depend on them for service as they were excellent in going the extra mile and fixing something,or repairing it before any problems to occur,and saved on the shipping.
To all,have a great day,enjoy your scanning....

"Also, I have the GPS thingy installed in the car. I’m unsure as to
> how the channels should be configured in terms of “location
> control”, etc."

I just completed a round trip from my home in Ct. to Daytona Beach Fl. I used the national database with just the service types I wanted selected. I set the range and I actually caught the scanner in the act of updating itself (one of many) after reading the GPS coordinates as I cruised down I-95 (which runs the entire length of the eastern seaboard). It loaded the states and then it acted upon my choices of service types and I was able to monitor those services. There were some avoids I needed to enter manually due to front end overloading and frequencies being used for strictly data. I also remember what I believe was encryption usage-it amused me at first but that didn't last too long before it got avoided also!

As far as configuring channels, you wouldn't have to worry about that if it's traveling long distances thru many states like I did. If however, you plan on using GPS within a county in Ct., say you want to have the scanner turn on and off towns/cities while driving through a county, and you are getting your updates from Uniden or RadioReference, you would need to change the GPS coordinates for each town/city because they don't have differing coordinates for each town/city. The coordinates supplied in those databases are the same for all municipalities within a county. At least that's how the database was set up for Ct. I live in one town and the town next to me has the same coordinates as do all others in the same county. I started to edit my County by supplying a centrally located coordinate for each town just to see how it played on the scanner but tired of the effort after realizing the counties in Ct. are so small geographically it wouldn't make too much difference... I'd get overlapping. And since I didn't buy a scanner to lock it down to only the one town/city where I happened to be, it didn't make much sense editing every radio system's coordinates within each town/city. (If I cared to do that I'd use the many scanners I own-I never got rid of the older ones-and dedicate a scanner to a particular town, city or county, then put up placards, labeling the scanners with what geographical locations they were listening to! But I'd never get to turn them all on at one time without the wife strongly suggesting I change my personal GPS coordinates-to another state!☐

PT0 and PT1 are TDMA. If you see them on the screen but hear no audio,
it is possible you are monitoring encrypted TGs which will not decode.

TDMA (DMR) requires a different upgrade, which also costs $50. Until that time all you would hear on that frequency is noise.

ALL of the digital modes have the ability to be encrypted, which as it's illegal in the US to decrypt without being a user, the scanner will ignore that traffic. Which means that you, the listener, need to find out what if any channels (users) are encrypted.

Likewise it is up to you to find out if the system is simulcast (all sites sending exactly the same data) or if you're not hearing your desired area because there is no local (to you) user on that talkgroup(s). [P25 user radios send data to the controller of the network to advise what talkgroup is wanted, the controller then provides it via that site. If no one wants the dog catcher for example on the site you're hearing, you'll never hear the dog catcher.] Worst case example, presume a state wide network; if you're in Dallas you can't expect to hear Galveston PD unless a GPD officer just happens to be in Dallas AND uses the radio, To provide everyone everything everywhere defeats the purpose of trunking; it's inefficient use of resources (spectrum).

I hope this makes it a little clearer for you,

P25 Phase 2 is also TDMA, and it's included in the base x36HP. He's
trying to listen to a P25 system, so he should be able to hear the audio.

If it's encrypted, he'll hear the encrypted audio because so far the
x36HP scanners don't mute Phase 2 encrypted audio, although they do mute
encrypted Phase 1 audio.

Rick,

You state...

"If it's encrypted, he'll hear the encrypted audio because so far the
x36HP scanners don't mute Phase 2 encrypted audio, although they do mute
encrypted Phase 1 audio."

Referring to Phase 1 encryption; Wondering if the scanner resumes scanning or just sits muted on the Phase 1 encrypted transmission until finished? The reason I ask is I'm noticing prolonged delays when certain Phase 1 systems are scanned... like when the squelch is wide open, causing the radio to slow its scan rate. An encrypted signal that is muted but not totally ignored, where the scanner sits on the active channel until the end of transmissions might explain why?

Thanks for the informative post,

Bill

Uniden doesn't announce new products more than six months in advance of their release and often doesn't until they are released.

The product manager for Uniden has said that the x36Hp is going to be the flagship product for the foreseeable future. I see no reason not to believe him.

Gary,

As UPMan had stated previously, UNIDEN does not divulge marketing info relating to possible new ideas. Asking them if they are looking to put into production, a new scanner BEFORE they announce it will get you nothing from them. Only after a press release (by them) will they entertain questions. (I guess all employees that have knowledge of what's in their pipeline are sworn to secrecy until after the press releases.)

The new scanner/CB radio is an item that makes this point. Nothing about their developing this radio was public information.

A point that should be made about this new release is this; Any interest in this Scanner/CB combo should be conditioned... the scanner side of the radio is somewhat limited to what it can receive... it appears the radio was developed with the over-the-road trucker in mind... will it receive certain bands (other than public safety) such as the aviation band? I don't think it does. If not, then it's not the same thing as combining a full service scanner with a CB radio. I believe it's a limited scanning capable CB radio for those interested in receiving public service (police & Fire) systems only.

Check out the description and specs to see if the radio fits your needs.

I also wonder if it belongs in this news group which is for the BCD536HP. But if not here, where? I mention this as a thought in passing, having no objection personally.

Uniden had a remote mount head. It didn't sell well.
So, what Uniden thinks is based in real world sales figures.

Siren effectively gives you a remote head with a color display.
And the best part is that you can make it as large as you want.

I use my iPhone in the car with Siren. Not perfect but does what I want it to do. The color display IS nice. I just wish ALL the displayed functions actually worked.

A BIG plus is that using your iPhone with Siren does NOT disable the phone and messaging functions. When a phone call has ended, it reverts back to Siren mode.

Usually.

If it doesn't disconnect from the WiFi.

Hello Rick,I am trying to monitor the Lake County Public Safety,Project 25,Phase II,APCO-25 Common Air Interface Exclusive,and a foot note is saying that, some talkgroups on this system are using Project 25 Phase II TDMA modulation,OK.Now,the question I am trying to figure out is that do I need the (DMR) upgrade or the ProVoice upgrades,either one to receive a TDMA Talkgroup,or should the scanner be able to monitor the TDMA as it is a Phase II system? I see that I do get a few P25,PT0,PT1,etc coming over the scanner,I understand this is the P25 system working,but it seems that some of my locals that had changed over to the P25 Phase II,and nothing heard from these groups,and if they are TDMA,would the scanner receive these TDMA groups and broadcast them,or does the upgrade decipher TDMA groups in order to pick them up and broadcast them over the scanner.
It seems the Talkgroup with the letter T in the Mode list does not come over the scanner,you have (D) digital and (T) in the Mode list,Digital seems to work,but anything with (T) seems not to receive at all.This is why I am wondering if I needed the upgrade for TDMA receive?
Been reading,but I do not seem to get any help from anything I have read.Anybody read anything for this or knows if their scanner picks up TDMA with out the upgrade.Thank you,I hope I explained this for all to understand.Thanks for any help or advice in this time on need.Thanks to all,Mark......

If you see the PT0 and PT1, those are the time-slots of Phase-II (TDMA) talkgroups used in P-25 Phase-II; so it's working correctly and decoding Phase-II (TDMA). You don't need any add-on decoding protocols as P-25 Phase-1 and Phase-II are included in the x36 line already.

If you aren't receiving certain talkgroups that you know have migrated to the new system, it may be due to other problems such as the possibility of certain talkgroups not being broadcast across all repeater sites or improper SERVICE TYPES being selected on the scanner. In many Motorola trunked systems, sites only broadcast talkgroups for those which have subscriber radios affiliated with that particular 'cell' (repeater site).

For example, if you live on the north side of the radio systems coverage area and the dog-catcher is talking to the dispatcher when he's driving around the south side of the coverage area, there's no reason to put that conversation on ALL the repeaters throughout the system - so you may not hear it unless you're tuned to the site(s) which are carrying it and that you've got a good strong signal from that site (or sites). TDMA type systems use many smaller (weaker) sites than analog trunked systems (usually)

A design issue with digital voice transmission on multi-site trunked systems is that the size of individual sites' coverage area in SIMULCAST (where the identical frequencies are used at multiple sites carrying identical information) type systems is much smaller than in analog systems. The digital stream of voice data, if received from two or more different simulcast sites, must arrive at nearly the same time from all in-range sites or destructive interference will occur. The distance between simulcast sites is now cut down to 2 miles or less so the system will now have many more (but smaller, weaker) cells in its site layout plan than the old analog system it replaced. This further adds to the difficulty scanner-users have in picking up what they want to, especially if you're equidistant from two or more sites in the system.

One solution may be to install a highly directional antenna, such as a yagi, on your rooftop or a tower with it pointed at the site (or sites) you wish to hear. It may allow you, through careful aiming, to pick up just one repeater site while attenuating others that cause simulcast interference. This method can also help you pick up the dog-catcher etc. when they're not affiliated with a nearby site closer to your location but it won't guaranty you receive 'everything' on the system. That's not the way the system was intended to work.

Best of luck,

Bob - KB1VUA

It's much easier though to control a real scanner with an actual knob and buttons when driving as opposed to a 'virtual' display on a tablet or cell phone. And actually, with the california hands free law, it's probably not a good idea to use a phone / tablet :)

I paid the extra fees for programming for this scanner. It picks up junk, (FM stations, national weather service, some type of squelch or other irritating sound, etc...) All I want it to do is scan the fire dept channels for my city. Nothing else. It is EXTREMELY frustrating to not be able to do this.

The display on Siren is much better than the native display on the 53HP. Not only is it bigger and brighter, it also shows more information. I mount my phone in a cradle so I don't have to hold it when I'm driving.

I use it as a sort of mini MDT, so I have Siren, Google Maps, and my phone available without having to do more than reach a few inches.

My scanner is close enough that I can access the few functions that I can't or don't want to use on Siren pretty easily.

As MCH wrote, the RH-96 control head didn't very well when Uniden released it. I think a big part of that was that it didn't do some of the things that it needed to do, plus it couldn't be used to turn the scanner on and off. You can't do that with Siren, either, but it's still a lot better than the older separate head.

Lance, it's unfortunate that you feel this way. I suggest you talk to the people you paid extra to and see what they can do for you.

Any new piece of technology has a learning curve. The most critical part of the leaning process is the amount of work you put into it, not how much you paid for someone else to do it for you. It takes effort (a lot of effort sometimes) to learn this stuff. I suggest you start with <http://new.marksscanners.com/536/436_536.shtml> and go though EVERY SECTION while sitting in front of the scanner. Try EVERYTHING and practice using all the buttons and menus till it becomes familiar to you.

Nobody can learn if for you - you have to learn it and do your homework.

While there may be a handful of people which cannot use it, the vast majority can use it fine even if using only the basic zip code entry. There are also some sources that will program it for you, so all you need to learn is how to plug it in and rotate the on/off/volume knob.

Some will learn the various features and get more out of it, too.

I almost cry when I read how well your Siren app is working for you - on your I-Phone. The reason for the tears is that I am in the other half of the world that uses an Android phone. It has been over two years since Upman demoed the I-Phone version and commented that the Android version would follow. Unless I missed it there has been no Android release and no announcement or explanation. Have you or anyone else heard anything on this? Comment from Upman????

The display on Siren is much better than the native display on the 53HP. Not only is it bigger and brighter, it also shows more information. I mount my phone in a cradle so I don't have to hold it when I'm driving.

I use it as a sort of mini MDT, so I have Siren, Google Maps, and my phone available without having to do more than reach a few inches.

My scanner is close enough that I can access the few functions that I can't or don't want to use on Siren pretty easily.

As MCH wrote, the RH-96 control head didn't very well when Uniden released it. I think a big part of that was that it didn't do some of the things that it needed to do, plus it couldn't be used to turn the scanner on and off. You can't do that with Siren, either, but it's still a lot better than the older separate head.

I learned very quickly to use the "Avoid" button on the front when a Channel came up I didn't want to hear until I finally figured out how to program it, disabling the groups I didn't want to hear, programming just those frequencies I wanted. Only problem with "Avoid" is that it reset is the unit loses power.

Tim

On Apr 1, 2017, at 6:34 PM, MCH mch@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

While there may be a handful of people which cannot use it, the vast
majority can use it fine even if using only the basic zip code entry.
There are also some sources that will program it for you, so all you
need to learn is how to plug it in and rotate the on/off/volume knob.

Some will learn the various features and get more out of it, too.

"I wouldn't buy it, it is too hard to use."

It could have been worse, a lot worse! (Programming and operating). I have no objection with the statement but feel the reasoning behind it should be clarified...

Scanners have become much more complicated with the advent of trunking and digital modes. I remember throwing the owner's manual over my left shoulder and just winging it prior to trunking. The only real innovative improvements up until then were synthesized receivers which made crystals obsolete and tone coded squelch.

But then came trunking. It was the industry's solution to the problem of "more requests for frequencies than could be allocated". There are a finite number of frequency allocations available and we were or had run out! Trunking promised to consolidate radio traffic on fewer frequencies.

With the introduction of trunking, the ability to program your new trunk capable Scanner just became a nightmare. Which brings me to my reason for this post...

The Uniden Home Patrol series of scanners that allow for the ability to easily updatable databases, and a simple user friendly method of letting the scanner know where and what to scan (enter a zip code and choose the different service types you want) shows that the industry has stepped up to the plate when it comes to keeping a scanner to an acceptable level when talking about "ease-of-use".

Remember, the scanner manufacturers didn't cause the industry to look at other ways to free up spectrum such as trunking which made programming by hand difficult. But they did come up with a workaround whereby they made programming a breeze. And yes, I do realize they understood if nothing was done to make programming easier, scanner sales would suffer possibly to the point of no return.

But comments that state "I wouldn't buy it, it is too hard to use" are true in some cases, there are those that don't care to bother with anything more than the on/off switch. I don't blame them. They could care less about any technical aspects... only interested in listening. But the statement could have the effect of making it sound like the complexity of programming is the manufacturer's fault. Just the opposite, they were forced to accommodate trunking and have done wonders to keep the scanners as user friendly as possible.

From: Bryan King
Topic: 3654 Message: 4555

I have had my 536 for about two weeks. I have a question about the wifi option and the siren app. Can I have the scanner at home and be in my car and listen to my scanner by using the siren app. I can use the app as long as I'm in range or the router. But when I go in the car the app quits working. Thanks for the help. Ps I do like the scanner. I'm still trying to learn how to program the trunk systems by trial and error hopefully I'll figure it out

Unless you hit it twice (quickly) which makes it a
Permanent Avoid that is not reset on power cycle.

Yes you can. You need to specify your home IP and set up the forwarding in the router. Local IPs do not work "outside" your home network.

There are also programs that do a very nice job at streaming your scanner over the internet. I generally don't make SW recommendations due to not wanting to tick authors off (again), but you can Google it.

You can use the Service Types to restrict what you hear or you can use the AVOID function to avoid Channels, Departments, or entire Systems.

A more effective way would be to use Sentinel to read the scanner, copy the currently selected channels to a Favorites List, then edit that to what you want and write that to the scanner. If you do that make sure you select MONITOR ON for that FL in your profile and disable scanning the main Database.

There are likely YouTube videos to show exactly how to do this.

I have my 536 connected to the Internet and can monitor it using any scanner App. radioreference.com <http://radioreference.com/> can help you with the set up. I would prefer being able to use the Siren App on my iPhone, but, with an Apple router, I've not been able to make the port-forwarding work. We used port-forwarding in the school district I retired from which assigned an outside IP to a private IP (such as your scanner) on the local network. Works fine as long as you have extra IP numbers to work with.

There is a single port and a range of separate ports. I forget the specifics, but you can Google it. An easier option might be to make the scanner IP the DMZ IP which means anything not specifically forwarded to (or requested by) another device will go to the scanner. No, that will not affect your other devices.

I don't recall the exact ports. There is a single one and a range of ports. No, you cannot specify a fixed IP in the scanner. I wish they would add that. It should be trivial to bypass DHCP and specify the port locally. But, you might be able to set your router to always assign that device (that MAC address) the same IP every time.

Remember, the scanner manufacturers didn't cause the industry to look at other ways to free up spectrum such as trunking which made programming by hand difficult. But they did come up with a workaround whereby they made programming a breeze. And yes, I do realize they understood if nothing was done to make programming easier, scanner sales would suffer possibly to the point of no return.
But comments that state "I wouldn't buy it, it is too hard to use" are true in some cases, there are those that don't care to bother with anything more than the on/off switch. I don't blame them. They could care less about any technical aspects... only interested in listening. But the statement could have the effect of making it sound like the complexity of programming is the manufacturer's fault. Just the opposite, they were forced to accommodate trunking and have done wonders to keep the scanners as user friendly as possible.

I have the ports on a note, I think I know where I left it... I'll look later.

You CAN have the scanner be assigned to a specific IP address by setting the router to reserve and assign to the scanner MAC address. Then leave the scanner as DHCP, it gets the same number each time. In fact you have to do this to get consistent results in port forwarding.

Then you port forward the control (one port value) and the audio (a range) to the scanner (from the outside).

The real trick is know what the public IP address is into your network. Most use DynDNS or similar; I have other options since my IRLP node is on my LAN too.

Ultimately, I found it was simpler to use a program that played the audio on a computer, reroute that audio into a virtual cable, then into Skype. (Easier than it sounds). Or the same app along with TeamViewer and a control app.... lots of ways it can happen.

I do have the capability of assigning an IP by MAC address, don't recall seeing the 536's off the top of my head.

I have been monitoring this group for years and did not know the Android app had been released.

I have it running on my phone now and it’s great.

I too would like to know what the ports are so I can set up my router to pass them. I’ve searched every term I can think of but no joy so far. My router doesn’t have a DMZ so that’s out.

I looked at the Wi-Fi info page Joe. It shows router name, IP address, MAC address and version number but I don’t see the ports.

Glad to know that it’s out and working.

Don, KE4JD

4574. Re: [BCD536HP] Siren app

Yahoo group: BCD536HP
Date: 2017-04-03 00:27:30 UTC
From: Rick WA6NHC
Topic: 3654 Message: 4574

Ok, my notes aren't as complete as I remember. You're fortunate I found them, I'm prepping for a move to another state and the condition of the house is less than optimal. ;-) There was an extended discussion on this about remote access two (three?) years ago, in the archives somewhere.

Audio is on port 554 (but I remember that is a range of ports, you'll have to look up the protocol specs and the actual port is negotiated upon connection; the spec is written broadly, so you'll have to figure some out). Running VLC seemed to be one of the best ways to manage that, I never finished looking at that path (runs on multiple OS).

Control port is 50536 (you redirect incoming on this port as well into the scanner).

If you connect to the '536, it can only handle ONE connection for audio at a time. The LAST one to connect wins. It is easily confused, so this isn't the best means (a restart of the '536 is the only recourse). Using an intermediate server (one scanner in, XXXXXXX audio paths out) would be more stable.

Ideally, someone would write a web page to provide control, active channel indication (what am I hearing?) and audio to more than one listener withOUT having to route it via Broadcastify or similar. Then I could simply add that page to my server as another page. That was my intent, but I ended up buying another scanner and if I want to hear what's going on at home, I use TeamViewer and the two apps for control and audio to hear the home scanner... not perfect but it's secure and it works. As long as there is at least 3G speed, I have full control over my radios, including the scanners, via my iPhone, iPad or laptop.

Geek hat firmly in place, I like toys, duh.

You can also run VLC on an IOS or Android device to connect to your '536
instead of Siren. Audio only, no control, but it's a start.

If the '536 is on the network, you have to see which IP addresses the router has assigned (IN the router, not the '536); that will show you the MAC addresses, pick the one matching the '536 and reserve it to a fixed address. Leave the '536 as DHCP.

I do this routinely with ALL the (WAY too many) devices on my network (in particular, printers). If your router also allows assignments outside the range of assignments you've told it, it also shows quickly those who are 'visiting' your network (they're within that range; your stuff isn't). You can then take action accordingly, if required. Just a quick and dirty way to detect net hacking.

I'm only a couple of weeks into using my DCD536HP radio and was sucked in by the "just enter the ZIPCODE" (or grid) features of the scanner. It works, but floods the scanner with hundreds of frequencies and agencies most of which I have no interest in. The receiver is surprisingly sensitive in my location and I pick up stations a county or two away at times.

The Siren software is necessary to filter and isolate what you want to hear and that has a learning curve. The radio and its manual also have a steep learning curve so this is more than just switch on and listen. Intimidating to those of us who are new to scanners.

So far I've managed to isolate the dozen agencies I want to hear but out here in the suburbs they seldom have any interesting traffic so I widen the area.

My patience with this radio is being rewarded. Slowly but surely.

You can set the Service Types in the scanner itself
(nothing else needed) to limit what you hear.

You STILL need to do some blocking and deleting. Along with police frequencies you'll also get school buses, security guards and mall cops. For Ambulances you'll also get medical transportation vans. Follow? Yes, it's easy to punch in a zip code, but you still have a lot of work to do.

If you're staying in one generic area (not leaving the county), it would be in your best interest to learn how to make a 'favorites list' (FL). That way you have full control over what you want to hear BUT you will still have to set the services you want. Not all are obvious (weather is under Federal, sometimes the agencies use the 'interop' channels for dispatch or tac etc). This is where learning Sentinel pays off.

For example, I have one list for Fire (I actually split it down to 'winter' and 'fire season'). I have another for local Law Enforcement (LE). I have another for ALL the fire frequencies in the state when large fires happen (they utilize frequencies from anywhere and it's the simplest means to not miss hearing something). Yet another for ALL the CHP (State Patrol anywhere else) and so on. That way I can quickly select what I want to hear 'right now' without hearing things I don't want to hear. It takes a little time to set up, but simplifies the daily use and it's efficient.

If the service is not 'on', you won't hear it, regardless of your list(s). Think of service as a gross (wide) filter, then your fave list will be specific (withOUT punching avoid so often).

If you travel, then careful selection of the services is still required but you'll learn where the avoid button is as you change regions (requires a GPS for autoprogramming). The x36 are easily the best scanner I've owned and since I travel, the autoprogram feature really pays off for simplicity (good background info on the area activity, plus I can hear the events that may cause me to change routes).

You'll get there, the learning curve isn't that steep once you start climbing it.

There certainly IS a learning curve. This is NOT the 20-channel crystal scanner you had back in the 80s!

Thanks to Radioreference (which I hate, but it's what we've got), yes, you do have to lock out or delete a ton of stuff you don't want.

I've had mine for two years, now, and I'm STILL tweaking it and figuring things out.

The software is Sentinel, not Siren, that manages the programming.

Yes I need to play with the Sentinel, I have not looked at it closely at all.

Good tips and I'll check out you tube as well. Thanks guys!

Subject: Re: [BCD536HP] Select specific frequencies

You can use the Service Types to restrict what you hear or you can use the AVOID function to avoid Channels, Departments, or entire Systems.

A more effective way would be to use Sentinel to read the scanner, copy the currently selected channels to a Favorites List, then edit that to what you want and write that to the scanner.

If you do that make sure you select MONITOR ON for that FL in your profile and disable scanning the main Database.

There are likely YouTube videos to show exactly how to do this.

I doesn't work here either. I live in Cedar Lake,IN and all I get is Illinois,Will,Cook,just the IL surrounding areas. I have yet to hear a Indiana Analog or Trunking channel at all. This does not make any sense as it is to find local channels.I play with the range settings to see if that does anything different,no luck,I shut off different Services to try to even get anything local,like Business,Public Works,Utilities,Schools,Transportation,everything Illinois.Scanner database is all updated,Centinel is the latest Version. Totally confused with the functionality of the Zip Code function.Seems that the Close Call is a waste also,as I have a Diamond Discone Antenna up around 35 to 40 feet up,I would think I would get Indiana stations before I get Illinois,and the Illinois receive is great,get plenty of bars on the receive,but need to get my locals before IL.I need St.John,Cedar Lake,Lowell,Scherriville,Griffith,and my State and County.When I use Centinel,and set my Favorites,I receive a few,but seems the ones that are TDMA,don't hear them,but I do get a few Analog systems,still not sure if this scanner is working correctly,tried everything,watched every video,read every post,read every book,manual,still not sure what is going on?Tired of complaining and whining,have a great day all,may purchase another make and try it out,any suggestions on different model to try,thank you,still love the Uniden,been the only scanners I have ever purchased,and had no issues at all,love em....

Well, Cedar Lake Indiana is right in the middle of the 4-site simulcast system for Lake County so you should be getting something on the Lake County Public Safety P25 Phase-II system. There are lots of encrypted talkgroups but there should be enough non-encrypted ones to see if it's working. If you're close to one of the 4 sites, you will only be hearing that one site and have no simulcast distortion issues - but if you're within easy range of 2 or more transmitters you could be getting multi-path or simulcast destructive interference with the outside discone antenna. Digital communications really hate multipath and simulcast but the more expensive radios the system uses are less prone to problems than your scanner.

It would pay to try taking the scanner mobile and see if you can get to any other locations where the Lake County Public Safety system does come in. If you receive it better from certain locations but not from your location, I'd suspect you've got a simulcast interference problem. The solution to that is usually to make the antenna directional rather than omnidirectional. A small 700-800 MHz Yagi would likely do the trick but only for that one system, of course.

Hello,I am picking up some PT0 and PT1 and I see some P25 also across the screen,and it sounds like digital. I see the TGID numbers also come across,as I am not sure who is who,as I will have to use Radio Reference to decipher what and who it is.But I know I am not getting some local TDMA local municipalities that had change over to Phase II,as I receive them when they were Phase I. Seems like they disappeared when the change over,but I get my home town who still is Analog.Totally confused,as I may have to read up a bit more,and play around with the Discovery mode and see what happens.I will play around,look up Talk group ID's,and figure out,it is possibly me,not sure,will need to look at the Talk groups and figure who is who.Thanks all,goofy scanner,nothing is easy any more,but you need to learn.Thank you all,Happy Scanning,love it,,,,,,,

On Tuesday, March 28, 2017 4:36 PM, "Rick WA6NHC wa6nhc@... [BCD536HP]" <BCD536HP@yahoogroups.com> wrote:

TDMA (DMR) requires a different upgrade, which also costs $50. Until that time all you would hear on that frequency is noise.

ALL of the digital modes have the ability to be encrypted, which as it's illegal in the US to decrypt without being a user, the scanner will ignore that traffic. Which means that you, the listener, need to find out what if any channels (users) are encrypted.
Likewise it is up to you to find out if the system is simulcast (all sites sending exactly the same data) or if you're not hearing your desired area because there is no local (to you) user on that talkgroup(s). [P25 user radios send data to the controller of the network to advise what talkgroup is wanted, the controller then provides it via that site. If no one wants the dog catcher for example on the site you're hearing, you'll never hear the dog catcher.] Worst case example, presume a state wide network; if you're in Dallas you can't expect to hear Galveston PD unless a GPD officer just happens to be in Dallas AND uses the radio, To provide everyone everything everywhere defeats the purpose of trunking; it's inefficient use of resources (spectrum).
I hope this makes it a little clearer for you, Rick wa6nhc

If you change zip codes are your avoided channels previously selected cleared and do you have to start over when returning to that zip code?

When you avoid several freqs with a zip code is this when you use sentinel read from the scanner and copy paste that into a Favorite then edit?

Yes when you start over again, the (temporary) avoids are cleared and
you start over again. This does not seem to be an issue with GPS
managed range/programming

The avoids are TEMPORARY, so if you download into Sentinel, there is no
expectation that they would become permanent.

In the end, it's best that you create then upload favorite list(s) into
the x36, then you know exactly what you're getting without issue.

I travel. I have SEVERAL FL for the areas that I frequent but in
between, I use the GPS/service features to listen along the way. While
it appears that it's more tedious (can be) in the long run, it actually
saves time and frustration (and wearing out the avoid button).

"If you change zip codes are your avoided channels previously selected cleared and do you have to start over when returning to that zip code?"

I propose the following... please tell me if I've missed something as I have never done this but I think it's possible...

If you would like to preserve the current zip code programming after you have avoided all that you like, name it, save it to the computer program and make it a FL.
Or save the zip code program and edit it after naming and saving, using the computer and then use it as a FL.

What you outline is what I recommend as the quickest way to narrow to your preferred scan list (if you aren't a scanner expert very familiar with local channels).
1) Zip code.2) Spend some time Avoiding stuff it stops on you don't want to hear. After a short while, the list will be narrowed to a more targeted scan.3) Use the MENU --> Manage Favorites --> New Favorites List --> Add Current dB Channels function. This will add the channels in the narrowed down list to the FL you just made. UpManUpMan FAQ: http://info.uniden.com/UnidenMan4/UpMan -- Please read before emailing me directly

Favorites List Quick Keys allow you to quickly turn scanning on/off for a Favorites List by simply hitting the ## and E.

Good video it explained this process very well.

What are the quick key assignments for, what do they handle or process?

What you outline is what I recommend as the quickest way to narrow to your preferred scan list (if you aren't a scanner expert very familiar with local channels).

1) Zip code.
2) Spend some time Avoiding stuff it stops on you don't want to hear. After a short while,

the list will be narrowed to a more targeted scan.
3) Use the MENU --> Manage Favorites --> New Favorites List --> Add Current dB Channels function. This will add the channels in the narrowed down list to the FL you just made.

Site QKs are shared with Department QKs, so many people
use 70+ for the Site QKs so as to not get them mixed up.

If you have the same QK assigned to both a Site and a Department, they
will both toggle on and off together (although I'm sure there are some
who actually want that action).

You assign the quick key(s) to the favorite list(s).

If you have something similar to:

Quick Key FL Use
1 Fire FL
2 Law FL
3 Parks FL etc,

then while scanning; 1 enter dis/enables Fire; 2 enter dis/enable Law etc.

It's VERY convenient. For example, I don't listen to cops (fire is bad enough but the cops never shut up). BUT if something hot is going on like a major wreck, in two button pushes I'm hearing cops. When that cools off, two button pushes and I'm back to not hearing cops.

Yea! Someone else thinks cops talk too much and just listens to fire unless something major happens! That you for helping me see how I can switch law enforcement on and off when needed, which isn't too often. (I've been going through the menu to select which FL list to listen to.)

I use my FLQKs to separate geographic areas, then SQKs to separate more specific areas within those general areas. I relegate the PD/FD separation to the Department Quick Keys.

Not saying either way is wrong - there are many ways to skin a feline. (with apologies to felines and lovers of felines). Where did that saying ever come from anyway?

With me, it’s not that “cops talk too much”, I’d LOVE to listen to LAPD more, but I’ve locked out the main dispatch channels altogether and just listen to the “Tac” and “Talkaround” channels. Why? The Dispatch channels are so active that I’d never hear anything ELSE on the scanner! It would lock up on the Dispatch channel all day.

Fire is much more interesting, anyway. Actually, I’d rather listen to medical (paramedics), but in our area they use cell phones, for the most part, because of “privacy” concerns, so I’ve been told. In 40 years of scanning, I’ve NEVER heard ANY private information go out over the air, but everyone is so bugged about it these days, it seems.

It's not that they're 'bugged' but rather that they follow Federal privacy law, which has big sharp teeth for violators. There are strict protocols in place to make sure this law is followed and the result can be more severe than simple firing. Each state/county decides how to best follow the law and protect the agencies.

Digital cell phones are more secure (and duplex), which helps patient care by a more thorough discussion with the care facility resulting in better more effective treatment and the best available facility to receive that patient.

If you are talking about the HIIPA, the only thing it prohibits over the air is a patient's name, and I've never seen a case where a name determines treatment. (politics aside)

That the law, but the way it's implemented at the agency level to ensure the agency is protected is often stricter. There is also case law that shows that policy is equal to law in court (violating policy is violating law). In any case, the privacy of the patient is paramount.

The law is also specific, it's not just the name that can't be allowed outside a very small circle (those actively involved) but there can be NO identification given that could possibly point to a specific individual. In the early days, even frequent flyers (regulars to the ambulance crew) that the ED staff knew well, could have no inference about ID, not even by implication. The law extends to paperwork too, when a name is on a form, that form is locked away with a very short list of those with keys. The implementation is often harsher than the law and it can be a hurdle in times and places where clarity and simple is the patients best interest.

As I said, it's often simpler and secure to just use a cell phone. While I never heard an inappropriate conversation with the ED, including ID, it is a simpler more effective conversation. It ends up being a shorter conversation as well (fewer repeats, better clarity). (I never went to the Dark side of The Force, but the job required being around medics.)

Not politics, but a sharp toothed law and local implementation bordering on fear. And honestly, I'd rather listen to cops than medic chatter. <full body shiver> It's just that BORING and there is nothing to be learned from listening.

From: Bill Nolan
Topic: 4595 Message: 4608

Mark,

I'm going to climb up on my soapbox. I don't intend for this to sound like preaching and mean no disrespect to anyone, apologizing up front should anyone take this personally...

Medical channels will probably migrate to options that "secure" the transmissions of patient information, such as the cell phones you say are used in your area. (The use of cell phones may be a stop-gap measure until a permanent solution is in place.. but that's another story.) In my area the med channels are all transmitted in the clear. I expect that will change but presently, I can hear patient information transmitted by the ambulance to the hospital while enroute to the hospital. They don't give patient names but if the initial dispatch is in your neighborhood it's a good bet you know who it is. Putting two and two together in this fashion is not a legal way around the HIPPA Act, enacted specifically to ensure our medical records stay secure.

Worth mentioning; this relates to areas where the med channels are broadcast in the clear...

Should one of us hear a medical call in our neighborhood and decide to take our scanner for a walk, we must remember to keep the volume low or better yet, wear earbuds. It's one thing to show off our scanner and all it's fantastic abilities, but to allow comms relating to ones medical history to be broadcast for all the neighborhood to hear ain't gonna make any friends... and probably get a stern instruction to turn it off by the authorities. And if this happens routinely, it will bring more attention to the encryption "solution". Once that cat gets out of the bag it's a sure bet someone is going to suggest as long as your at it, encrypting other comms might be worth thinking about. I subscribe to the less said the better. Encryption, wether it's good or bad, does nothing to help the scanning hobby.

So it behooves all to scan responsibly. Showing off our new toys is fine just so long as the scenario is not using a comm sensitive incident.

Bill

JOE M.

I refer to the "intent" of the Act. True, I've never heard both the patient's name and their medical history included in the comms, but the scenario I describe shows it's not too difficult to tag a patient's name to their history. And I relate all in the hopes of increasing awareness among us... to think first before showing up on the scene. The use of a scanner comes with a certain level of responsibility, regardless of whether or not it's technically legal.

Not to mention that 'taking a walk' to a scene is expressly forbidden in many states. Being a looky-loo is only legit if you happen to be there, not if you choose to show up and you are expected to vacate the scene quickly. Being popped on a misdemeanor (in CA), with a scanner, is not the way to endear yourself to the folks charged with protecting you.

Now having said that, I use a scanner while in National Parks to hear the rangers reporting traffic jams from critters (and other amusements). Depending on the critter and quick access, I can then either vacate the area or head in... bison/elk, have thousands of frames, moose or bear I can ALWAYS use more frames (pictures). I just keep it VERY low key. I've also jumped into a medical aid call because it was life threatening, I was there, qualified to help and the closest unit was 20 miles away, in a park (25 minutes in a hurry)... I didn't mention a scanner, went in, helped, slipped away when the official help was at scene; all good.

While the public service folks KNOW that we listen; it's a place where staying low key (out of sight) is generally a good plan. Also remember that you cannot 'have any pecuniary interest' (make money) from what you hear on the scanner. Be cautious and we all win.

Ahhh... intent vs wording. Always a good debate, but for another list.

The intent never was to prevent putting two and two together in case you know details about a person or where they live. Soon they will have enclosed unloading zones for ambulances so people can't see who is being brought in. May as well block out those windows, too. And no more open doors as you walk through a hospital, as you might recognize someone. They will need headsets for those hospital radios that blare out the comms in the ER, too. This would all be done in the name of confidentiality. Of course, this is the same thinking that will mandate encryption for all communications in the future. Then people will complain about a lack of transparency...

That is one of those terms I may never keep straight. I know there are not two P's, but I can never remember if it's two I's or two A's. I usually think "Health Insurance Information Privacy Act".

Gotta laugh at Hippa which a lot of people think it is.

But WHERE specifically does the HIPPA Act covers radio usage?

This has been discussed many times and it always ends up being an "assumption" that radio traffic is also "governed" by the HIPPA Act.

As far as I've been able to discern from the Act, it applies to records-keeping and records sharing, digitally and maybe otherwise, needing to be done in a "private and secure" manner by the health care providers, insurance companies and any other entity that might come in contact with your "established" health records and history.

What's said on the radio is the kind of info also said on the scene of the emergency around many people all the way to the hospital/ER/shared rooms. And just to play Devil's Advocate, should the medics whisper to each other about the patient while they're tending to them on the scene so that by-standers can't hear?

Just saying...

There are many things that can constitute "PHI", or "Protected Health Information".

But the average scanner listener, even those of who are more than that, really don't care WHO the patient/victim is.

In out city (Los Angeles), the address of a medical call is sent to the MDT in the ambulance and the fire truck. You will never the name given out and hardly ever the address.

The only people who are really going to know who the patient is are those living on the same street, close to the address because they will see all of the emergency vehicles out front. All the privacy laws in the world won't help then.

There's many huge advantages to having the address broadcast over the air. Say Engine 10 gets dispatched to an address that everyone is familiar with. Engine 9, which is right near Engine 10, hears the call and realizes Engine 10 is going to be stuck on the call a long time. Engine 9 might place themselves in service and start driving around to put themselves in a position to cover Engine 9 and 10's area better...

4619. Re: [BCD536HP] Was: Quick key now legal mumbo jumbo

Yahoo group: BCD536HP
Date: 2017-04-07 20:50:13 UTC
From: Rick WA6NHC
Topic: 4595 Message: 4619

Specifically, it doesn't deal with radio except generically that patient confidentiality MUST be maintained at every level from first contact on and it is not limited to papers.

Since radio is a broadcast medium, the law applies to all radio exchanges (dispatch, hospital etc.) and it's one of the reasons that the hospital radio link is now in an enclosed (private) space AND that the language is very generic; the entire ED may be aware but not of specifics until that patient arrives. Cell phones make this FAR simpler, a private room isn't required for field-ED communications. The law also limits inter-company sharing of information, which is why you get the forms to sign (acknowledging your rights, granting permissions) EACH time you go to the ED.

One can discuss it on scene of course (typically limited to "Patient A, the redhead female", "Patient B, the male" etc.) for triage, you can discuss it at the station WITH YOUR CREW THAT WERE THERE for after action training discussions, but you can't discuss it with another shift or anyone who wasn't there. This applies to ALL involved in patient contact, doctors, nurses, lab techs etc. Only those CURRENTLY involved in THIS patient's care can know but it's limited to pertinent (right now) details.

In the early days, it was deemed so restrictive that if the patient also required "CDC precautions" (AIDS, Hep etc) the the responder/s could not be told of possible exposures after they transferred the patient because it violated the privacy law. That was amended, a few years later, at least by local policy (and it was a risk to everyone the exposed responder/s came into contact with, a HUGE gap).

The law doesn't have to make entire sense and this one created a nightmare in particular with computerized record keeping and paperwork. In real life, people talk, they share, they even gossip but they're very careful about who they tell specifics to when it comes to patients. Some things are inferred, some are hinted and over time one learns to listen more carefully and connect the dots to preserve ones health and longevity but nothing is ever supposed to 'be said'. The paper trail and security is the simplest, put the form in a locked box.

And it's also correct that if the bamboolance is at 123 Elm St again, the entire neighborhood knows who and what happened (Maggie is drunk again and fell down the stairs again); scanner listeners are part of that neighborhood. Remember the key phrase is 'reasonable expectation of privacy'. If the oncoming shift notes in the log that there was a medical response to 123 Elm St, they too can connect the dots, but cannot discuss it; which is proper and right because oh the stories we

COULD tell... Over time, each shift would meet the 'frequent flyers' and an understanding between shifts was simpler (not that anyone would EVER discuss a call of course :-D that would be WRONG, it never happens...).

So whatever you glean about a particular patient via a scanner; you are obligated to also maintain privacy if something is inferred or accidentally released. "Medic 98 went to 123 Elm St to collect a female patient that sustained an injury, who was then transported to the Bigtown Hospital" is fine; patient details are not. This doesn't limit you in other 'reporting' areas, delayed entry, jaws of life in use... it's only patient privacy matters that can't be released.

When I was reporting to a local FB group (overgrown county wide neighborhood watch), no details were released but because of my past life I could 'translate' what was heard, knowing from experience what was happening and how well things were progressing or not (vocal stresses, words chosen, terse language, little things) but patient information is a hard line that is NEVER crossed ("the male subject is now extricated and packaged for transport, code 3 to the helispot") even if I know more. The most I could say "it's (not) going well".

No, I'm not a lawyer, I preferred an honest job so I could sleep nights, ;-) There were entire days spent in training on the law when it came out and also each re-cert curriculum contains at least a 3 hour session on the current laws, HIPAA getting the most focus. The intensity of that training left the impression that this wasn't a law to be bent, even slightly, ever. To violate it was career ending with the high chance that your income in the foreseeable future could be taken from you as well (lawsuits).

But.... let's get back to scanners, this has gone astray...

Don't get too wrapped up in the "letter of the law" with what you believe HIPAA's abilities are. The Act merely provides handling restrictions and penalties identified if the handling restrictions are violated. HIPAA was created to protect against any carelessness when dealing with health history by allowing for penalties, an incentive to pay particular attention to these records.

And it does NOT specify for any particular manner of dissemination. In other words, the law doesn't care HOW medical history was leaked, lost or shared, only if it WAS. If it was, the lawyers will debate if it is an unintentional or intentional act and the courts will apply the necessary parameters, determining penalties.

And they aren't kidding when it comes to enforcing HIPAA. My wife is a Registered Nurse, works in a hospital setting. When I asked her to check in on a patient we both knew, I was told her visiting as a "friend" would raise flags. My wife was not assigned to our friend's case. But because she works at the hospital, she must abide by the rules set fourth by their legal staff. Those rules were created after a consensus of hospital opinions were studied nationally. I guess the bottom line is they were told not to do anything that could even remotely cause a concern under HIPAA. It's just too much of a hot button item.

The Act does not mention radio traffic, emails, or any other method of information transfer. Nor does it mention refuge. A few years ago bags of medical records refuge fell out of railroad cars and got scattered across miles of track. The refuge was on its way to be incinerated. Careless handling was determined to be the cause, but it did violate HIPAA. It was an improper transfer or sharing of records. So the Act doesn't care How it's violated, just that it IS violated.

All of which is splitting hairs, and missing the point... Intentionally allowing personal medical histories to be mishandled is wrong. Knowing this up front can help us act responsibly should we ever find ourselves in a questionable position. It's also drawing us off topic?

Hope this helps.

Bill

But WHERE specifically does the HIPPA Act covers radio usage?

This has been discussed many times and it always ends up being an "assumption" that radio traffic is also "governed" by the HIPPA Act.

As far as I've been able to discern from the Act, it applies to records-keeping and records sharing, digitally and maybe otherwise, needing to be done in a "private and secure" manner by the health care providers, insurance companies and any other entity that might come in contact with your "established" health records and history.

What's said on the radio is the kind of info also said on the scene of the emergency around many people all the way to the hospital/ER/shared rooms. And just to play Devil's Advocate, should the medics whisper to each other about the patient while they're tending to them on the scene so that by-standers can't hear?

Just saying...

> But WHERE specifically does the HIPPA Act covers radio usage?
>
HIPAA. it doesn't.

PHI, or "protected health information", refers to any information that can be used to identify a patient. Although primarily written/printed, can also be spoken, overheard at the scene or over the radio.

PHI is any information that is received or seen or heard by anyone other than someone who is authorized to receive it.

> This has been discussed many times and it always ends up being an "assumption" that radio traffic is also "governed" by the HIPPA Act.
>
Not exactly stated, but yes, presumed.

> As far as I've been able to discern from the Act, it applies to records-keeping and records sharing, digitally and maybe otherwise, needing to be done in a "private and secure" manner by the health care providers, insurance companies and any other entity that might come in contact with your "established" health records and history.
>
Again, primarily applies to "medical records", in whatever form they may be. But also applies to any possible identifying information, in whatever form it may be.

> What's said on the radio is the kind of info also said on the scene of the emergency around many people all the way to the hospital/ER/shared rooms. I agree. In the days before AVL, FDNY-EMS went to "silent dispatch" for their ambulance calls. Call data went out of the KDT system, and only the unit being dispatched knew that there was a call. Sure, if someone in another ambulance was continually refreshing their screen they might see the call, but for the most part that didn't happen.

What did happen was that units closer to the actual call didn't know there was a call unless they saw another ambulance driving by.

What they ended up doing was reverting in part back to voice dispatch. I think they'd give out the nearest intersection, not the actual address.

In my former system, not only do the dispatchers give out the address, but each unit responding has to repeat the address back. Some dispatchers will give out the number and the street, but some will give out the apartment number, or floor number. Which is superfluous, because all of the call details are sent over the air to the MCTs.

Plus of course we have AVL and mapping in the CAD system. But I digress.

From: Gary Saffer
Topic: 4595 Message: 4624

Incorrect, Joe. There is a specific emergency communications exemption in the HIPAA regulations.

We never sent patient names over the air, but that was because we didn't usually have them being a 9-1-1 only service. After 2000, we had MDTs in the ambulances and supervisor vehicles, so if needed, they could be sent that way. We also had department issued alpha numeric pagers, so very rarely information was sent over those. Very rarely.

However, the private service for the most part don't have MDTs and the only computers they have are for their PCR systems. Those systems don't generally have the ability to send names because of the way they are configured.

So, the private ambulances use their regular radio system. In my area, there are two that use scrambling or encryption. That's not for HIPAA compliance but is a hold over from the old days when ambulance companies used to steal calls, especially transfer calls, from each other. Old habits die hard.

The use and security of Protected Health Information (PHI) is very complicated, and not really a good subject for an email list.

Entities that use the "HIPAA law" as an excuse for encryption are either lying or woefully ignorant of the law.

I sit corrected. :-)

But, there is still no need to transmit a
person's name over the air even if you could.

Although if you said the patient's name was Donald trump, that might
affect the treatment - for the better by some and the worse by others.

(note the casual avoidance of taking sides there)

From: W1JCW John
Topic: 4595 Message: 4626

What would cause the audio even if I hold on a channel to not be consistent as I heard partial conversation?

It's not just P25 because I thought maybe I had to make adjustments.

Ideas / suggestions?

Thanks

John

Not enough info to tell. It could be many things:

1. Improper programming (programming a trunked system as conventional).

2. Close Call (non-DND), Channel Priority, or Weather Priority enabled.

3. Insufficient coverage (lack of signal strength).

4. Simulcast interference.

I understand and mostly agree with what you're saying Bill.

I'm looking at it more from a lawyer and court point of view. If it does NOT explicitly say you can or cannot do something, then is free game. Good subject though...

HIPAA was created to protect against any carelessness when dealing with health history by allowing for penalties, an incentive to pay particular attention to these records.
>
> And it does NOT specify for any particular manner of dissemination. In other words, the law doesn't care HOW medical history was leaked, lost or shared, only if it WAS. If it was, the lawyers will debate if it is an unintentional or intentional act and the courts will apply the necessary parameters, determining penalties.
>
> And they aren't kidding when it comes to enforcing HIPAA. My wife is a Registered Nurse, works in a hospital setting. When I asked her to check in on a patient we both knew, I was told her visiting as a "friend" would raise flags. My wife was not assigned to our friend's case. But because she works at the hospital, she must abide by the rules set fourth by their legal staff. Those rules were created after a consensus of hospital opinions were studied nationally. I guess the bottom line is they were told not to do anything that could even remotely cause a concern under HIPAA. It's just too much of a hot button item.
>
> The Act does not mention radio traffic, emails, or any other method of information transfer. Nor does it mention refuge. A few years ago bags of medical records refuge fell out of railroad cars and got scattered across miles of track. The refuge was on its way to be incinerated. Careless handling was determined to be the cause, but it did violate HIPAA. It was an improper transfer or sharing of records. So the Act doesn't care How it's violated, just that it IS violated.
>
> All of which is splitting hairs, and missing the point... Intentionally allowing personal medical histories to be mishandled is wrong. Knowing this up front can help us act responsibly should we ever find ourselves in a questionable position. It's also drawing us off topic?

4633. “Nothing to scan"

Yahoo group: BCD536HP
Date: 2017-04-14 14:52:04 UTC
From: kb6kgx@...
Topic: 4633 Message: 4633

So, it’s been quite a while since I posted about a problem with my normally trusty 536. But here’s what’s happening. Maybe someone has some ideas. My programming is set up with about 50 or so Favorites Lists. I’d noticed that with two of them, I wasn’t receiving anything. I’m in Southern California (Los Angeles area). One of these FLs is the CHP (California Highway Patrol) for the Orange County area and the other is the Orange County Fire Department. Strange that both FLs I’m suddenly not hearing are both in the same geographical area. But, anyway… When I select the channel manually (with the CHP, I haven’t yet tried it with the OC Fire), I’m able to hear the comms. But the radio is not scanning them. With CHP there are two sub-lists, one with the “Base” and “Mobile” channels and another with the “Wide” channels, which are 700 Mhz “extender” channels. The radio is scanning only the “Wide” channels and not the other ones. Going into Sentinel, everything shows as it should. Nothing is avoided, all appropriate check boxes are checked. With OC Fire, and this is interesting… again, in Sentinel everything is there and looks as it should. I tried this trick, and turned off all the FLs, and turned on only “Orange County Fire”. When I did that, the radio beeped and the display read, “Nothing To Scan”. Yet, everything shows in Sentinel. Both “Monitor” and “Download” areas are both set to “On” in Sentinel. I have deleted and reinstalled these channels twice, now, and still getting the same result.
Ideas?

Topic: 4633 Message: 4636

Kb6kgx,

Additional to what Joe M. has suggested... my first thought is a corrupted SD Card. If all the other FL's or systems that you have active in the scanner are working, it would indicate to me that service types and QK's are not necessarily the problem, and looking elsewhere is warranted. I am not saying Joe M.'s suggestions aren't accurate, checking those simpler items, if found to be the problem, will save time, eliminating formatting/replacing SD Cards. It's just that my take on the problem is with a radio that works fine on Monday but not on Tuesday without changing any parameters. That tends to lead me down the memory path. Why else would only a couple of entries (FL's or systems) fail to perform while the remainder of the memory function?

When the fix is found, please post here your findings.

Bill

Yes, all appropriate Service Types are enabled. In not, then NONE of the other Fire or police channels would be heard. But that was the first thing I checked.

You might be correct. Corrupted SD card. I'll try replacing the card , see if that solves the problem. Can't see how to reformat the card in the radio. "Delete User Data" doesn't do anything to fix it.

Yes. Just about a year ago, I had that happen. I sent it to Uniden for a non warranty repair. They charged me for the scroll knob replacement and did the RTC repair at no extra charge. My RTC didn't repair, which is why I never mentioned it.

If your scanner hasn't had the RTC repair yet, send it in for that and attach a note that the scroll knob needs repair. You might get that done for free since they were offering to repair other things at no charge if the scanner was sent in for the RTC repair.

4642. Use just a system quick key?

Yahoo group: BCD536HP
Date: 2017-04-16 04:20:32 UTC
From: Evan Platt
Topic: 4642 Message: 4642

So never really used System quick keys... Just set up a few systems with SQK of 1. Is it possible to 'go' just to those systems? No FL or Dept quick keys, just systems? I hit '1' and the scanner just sticks at the "Quick Key Navigation" with "1" blinking...

Thanks :)

4643. Re: [BCD536HP] Use just a system quick key?

Yahoo group: BCD536HP

First, to "go to" a System like that, you want to use Number Keys.

To enable or disable a System, use the format .SQK ENTER but it will
only toggle the SQK on the FL you are currently scanning.

Joe M.

4644. Re: Use just a system quick key?

Yahoo group: BCD536HP
Date: 2017-04-16 11:15:43 UTC
From: Bill Nolan
Topic: 4642 Message: 4644

I never got around to bothering with the quick keys. Although beneficial, every time I catch myself thinking if I had used them I wouldn't be fidgeting around with my FL's, locking out stuff, I get sidetracked.

But what really impresses me is the ability to use the white buttons (System, Dept., and Channel). I find myself adding mutual aid and adjacent town freqs to a (conventional) system already included in one of my FL's, allowing me to lock down on a System and hearing additional systems. That way when my town calls for mutual aid from other towns (or vice versa) I just hit the white system button when that system is active. Since it's still scanning whatever I put in those systems, (Dept & Channel) I have my listening needs satisfied. I know it's probably not the most efficient use of the scanner's abilities but since scanning with the x36's isn't consuming my every waking hour, (I don't "live" for my Scanner) creating groups and assigning QK's gives me pause. Having to remember what QK does what... and carrying around a "cheat sheet", referring to it when the need arises just reminds me that I have suffered through my entire life, with CRS Syndrome. I could never remember anything for more than a minute or two unless I made a concerted effort. (A feat I had to perform in my former job. I had to enter better than 50 rooms, all with combination locks, each with a different combination, that I had to commit to memory because we weren't allowed to write them down! The facility I worked in is a govt regulated classified area with "Special Projects", requiring top secret, secret and special projects briefings from the govt for the people working there). Now that I'm retired, I hesitate doing anything requiring my committing to memory combinations, or anything, including something as simple as a QK!

I miss those 3 white buttons on my physically smaller BCD325P2, the radio I preferred carrying due to size and after the newness wore off I went back to my 436 with the white buttons! I guess my case is one of "old school".

I find myself more inclined to dedicate a scanner to a particular system, dept., or channel. (Admittedly a horrible waste of a scanner's abilities).
I've got enough scanners (at home) where I can lock them down on whatever I want... it gets a bit noisy at times... but on the up side, it drives the wife nuts! Which is how I show my displeasure with her on occasion. Now, when she wins an argument, which is most of the time, she adds "And don't turn on those damn scanner's!" Yup, I'm getting to her. She wants to know when something big is happening but she'd rather I build a sound proof man cave and update her from time to time!

Waiting for the next new release from Uniden,

Bill

The last several have been corrections to DMR and MotoTrbo One Frequency Trunk updates. There have been some issues with false TG IDs showing and the scanner not following OFT systems correctly.

When I do a "update firmware", it tells me I have the its current version. This is for a year, now.

.1 <Enter>?
Takes me to the quick key navigation screen, line shows
.1
Hitting enter does nothing...
Tried it with 1 <Enter>, same thing...

Then SQK1 is not assigned within the FL you are scanning or is AVOIDed
or not available for some reason.

I should add that the last series of updates for the DMR and OFT issues
are NOT official releases. They are being released on the Radio
Reference forum for people who want to try them out. Once the issues are
resolved, they will likely release official updates via Sentinel for
both the 536HP and 436HP.

I think the last official release was for DMR, but there were probably
other fixes in there as well.

4654. Audio choppy mute every 5 secs.

Yahoo group: BCD536HP
Date: 2017-04-18 12:18:40 UTC
From: W1JCW John
Topic: 4654 Message: 4654

I loaded the regular database and I hear all contacts completely without audio being choppy so there must be something I need to check when I create my FL.

Once again I have the FL running and it will mute or be choppy every 5 secs.

It can be any station received, audio will be fine, then mute for a few secs then back to the conversation then mute again during the same transmission.
It seems cyclic so it must be a setting in the FL.

Any ideas ??

Thanks
John

Subject: [BCD536HP] Audio breaking up

What would cause the audio even if I hold on a channel to not be consistent as I heard partial conversation?

It's not just P25 because I thought maybe I had to make adjustments.

Ideas / suggestions?

Thanks

John

Joe M -

What menu is the Close call disabled in?

I was looking for that as it comes up to often and I don't care if it's close plus it's usually a radio FM radio station.

Sounds like "Priority" is enabled. I have mine enabled and it checks the channel(s) I have marked priority every few seconds and the audio cuts out briefly if one of the non-priority channels is transmitting.

Easiest way to change it is by pushing on the SQUELCH button. Change it
to CC OFF or to CC DND. (DND will not interrupt received transmissions)

Ahh yes, that was it - apparently it didn't save :)

So now that doesn't appear to turn everything else off? Or is there
something I should be doing - here's what I have:

I have my favorites list of basically everything I'd want to listen to
(Maybe that's not the best setup of the Favorites)? Is there an easy way to
turn everything off from being scanned except the systems I turn on? I
turned on SQKey 1, but it's still scanning everything on the FL... :)

From: MCH
Topic: 4642 Message: 4664

1. Make more than one FL

2. Assign SQKs to the other Systems and turn them off.

While you can only have one FLQK, you can assign a SQK to multiple
systems if you want to enable/disable them at the same time.

Joe M.

OK..
1.11.20 is the firmware in your scanner.
The programming software Sentinel is at version 1.07 (revision 5)

I don't wish to beat this into the ground, but my suggestion would be for Uniden to have a "Check for Updates" in the ABOUT pull-down of Sentinel, like most software, with a link that would take you to the appropriate place to get the update - similar to the Firmware in Sentinel,

Paul W.

My Sentinel is 1.07 (05). I have looked for “check for update” in the Sentinel menus, but cannot find it.

Was the “1.08 (05)” from UPMan a typo?

Roger

From: W1JCW John
Topic: 4677 Message: 4677

Oh yeah that was it Joe!

I was trying to figure this out for some time but didn't see the squelch button functions in the manual.

Now it hears all the qso and stays on the freq until done.

I have my FL running fine now.

Thanks!

Easiest way to change it is by pushing on the SQUELCH button. Change it to CC OFF or to CC DND. (DND will not interrupt received transmissions)

You get it by opening sentinel, then clicking on UPDATE,
then UPDATE FIRMWARE while your scanner is connected.

The firmware update is very easy - just connect your scanner to your PC, start the Sentinel app, click on Update and Update Firmware.

It's residing on Uniden's server. There is no "direct link". Uniden handles updates using the method several of us have mentioned.

Why don't you want to use the "official procedure"?

That would be a much less expensive way to go and would be
a dedicated receiver (as opposed to tying up a 536 for ADS-B).

Send me a direct eMail and I will direct you to
some good preamps and/or antennas if you need any.

4689. Discrimnator tap question

Yahoo group: BCD536HP
Date: 2017-04-19 15:25:47 UTC
From: Evan Platt
Topic: 4689 Message: 4689

Hi All,

For using the discriminator tap, does it matter what mode (NFM, WFM, AM, etc) the scanner is in? ie if I'm decoding something in NFM, does the scanner need to be NFM? Discriminator audio should be raw audio, right?

I don't wish to beat this into the ground, but my suggestion would be for Uniden to have a "Check for Updates" in the ABOUT pull-down of Sentinel, like most software, with a link that would take you to the appropriate place to get the update - similar to the Firmware in Sentinel,

4692. Re: Discrimnator tap question

Yahoo group: BCD536HP
Date: 2017-04-21 20:00:41 UTC
From: rhyolite@...
Topic: 4689 Message: 4692

Most scanner receivers have some internal logic that follows the mode AM/FM/FMW/CW/USB/LSB etc. The logic controls FET switches that change IF filter bandwidth and the de-modulator being used. (A software designed radio does most of this in DSP "CODE".)

In the case of an AM/FM scanner, there is an AM de-modulator that is usually a simple diode detector, and an FM de-modulator which is usually a quadrature detector.

The "Quad Detector" chip is where the "discriminator tap" is taken from. You must be in one of the FM modes to get any FM signal. It is usually "raw audio" in that there is no de-emphasis filtering applied to it and the bandwidth ideally extends from above 8 KHz down to nearly DC so that low data rates can be extracted without distortion.

If your receiver has an "IF tap", the signal there might be some frequency like 10.7 MHz or whatever your radio uses. Since it is a radio frequency signal, or "baseband", you can put any kind of de-modulator you wish, even a software designed radio at that point and decode whatever you wish on the center frequency the scanner is tuned on. The bandwidth of the IF tap depends on where it is placed in the receiver filtering chain.

4696. Re: [BCD536HP] Use just a system quick key?

Yahoo group: BCD536HP
Date: 2017-04-22 04:25:56 UTC
From: Evan Platt
Topic: 4642 Message: 4696

So interesting... Bug?

I rewrote the database. Every System was assigned a SQK. (So basically I could not listen to 'everything' but only selectivly listen.

Turned on scanner. "Nothing to scan."
Tried .1<Enter> - nothing (enter did nothing). .2<Enter> - nothing 3...4..5...etc - nothing.

Went into Menu, Scan selection, Select Systems to monitor. Enabled one of the systems - then it started scanning.

I can duplicate this - as it is, it's scanning. Turned 9 off. Back to "Nothing to scan."

.1 ... .9 <Enter> does nothing. Have to go back into Menu, Manage Quick Key Status, System Quick Key, and turn on at least one system...

From: MCH
Topic: 4642 Message: 4697

Not a bug. The scanner is doing exactly what you've told it. Here's why:

When you see the "Nothing to scan" message, you are NOT scanning that FL. In fact, you are not by definition scanning ANY FL. You are truly scanning "nothing".

Try this:

While scanning that FL (using whatever method you choose to get there), hit .2 and see if it enables SQK2, THEN disable SQK1. IOW, enable first then disable. That way you will always be scanning part of that FL.

What happens when you disable first is that you stop scanning that FL, and then you're telling the scanner to enable SQK in "no FL", and the scanner is complying with that request - enabling SQK1 in "no FL".

Another tip is to assign some System with no SQK. Add one Department and then one Channel. Make it a channel you always want to monitor or make it a channel that will never be active - such as a marine channel with a CDCSS code. That way, you will never be in the "not scanning a FL" mode.

Last tip: In your SW, enable at least one SQK. That way you will start scanning *something* and will be able to control that FL.

OK this is REALLY the last tip (and maybe the best): Assign that FL a FLQK. Then if you are ever in that "nothing to scan" mode, specify WHICH FL you are "talking about": 1.1 ENTER for example. Then the scanner will know you want to enable SQK1 in FL1. You will still be able to use .2 ENTER, .3 ENTER, etc as long as you are still scanning that FL. The Quick Key system was made to have SQKs nested within FLQKs, and DQKs (or SiteQKs) within SQKs. While it will work specifying just the SQK, it will only affect the FL currently being scanned.

From: MCH
Topic: 4642 Message: 4699

I'm not going to say what my first one was, but I recall being able to
get one that actually had 16 programmable channels! (or was it 10)

It still was able to handle several counties around me.

No CTCSS. No PC programming. But it did have a channel delay!
I was so excited about not having to buy crystals! Woo hoo!

MY first scanner was a 4-channel crystal-controlled handheld model. So, yes, we HAVE come a long way since then.

Yes, they're doing the clock and backlit display out of warranty for no charge. They did mine in one week and two days including shipping which they paid both ways!

Follow their directions at
*https://www.uniden.com/product-information/bcdx36hp-repair-campaign*
and you won't go wrong but read and follow their instructions!

I couldn't speak more highly of them if they paid me.

4704. Volume issue while in AM mode

Yahoo group: BCD536HP
Date: 2017-04-22 17:27:16 UTC
From: Bill Nolan
Topic: 4704 Message: 4704

When receiving AM signals (Aircraft) the 536 volume level starts out low but increases quickly to max, as the scanner is set at full volume. It is mounted in my vehicle and has a non-amplified external speaker attached. By comparison, I have my 436 portable also listening to the same FL as my 536. (Both scanners are programmed exactly the same, modulation set to auto, attenuation set to off.) I do not experience the low volume issue with the 436.

So far, the only difference I've realized is the 536 is using an external speaker, the 436 is not. And I have not disconnected the external speaker due to the 536 being mounted in a multi-radio console. It's a chore to unbutton it to get to the back of the scanner. Before I do, I want to ask if the speaker ohmage might be causing the problem. I have a Motorola commercial external speaker connected and don't know if it is a 4 or 8 ohm speaker.

What I can tell you about the speaker is that it plays very well on 2 other mode settings (FM and NFM. I haven't used the WFM or FMB modes). In FM and NFM the scanner's volume does NOT start low and increase, it only does this in the AM mode.

Comments?

Bill

4706. LTR Kinda O/T question

Yahoo group: BCD536HP
Date: 2017-04-22 17:44:10 UTC
From: Evan Platt
Topic: 4706 Message: 4706

SO kind of off topic, but thought maybe someone here might know (cough MCH cough)...

I have a LTR radio. I did some searching - and used some known systems. So I see for example 0-13-24.
0 is the Area. 13 is home channel, 24 is the LTR "ID", right?

I program the correct channels in LCN order, program the area and home ID, and the LTR ID (Using a CSI radio, they call it LTR Decode). I hear nothing. Am I doing something wrong? shouldn't that work?

Feel free to reply off list if you have an idea.

Thanks :)

Not positive, but I *think* the ID is the entire string (0-13-024).
Never programmed a CSI for LTR.

Joe M.

No. Both the 436 and 536 have AGC set to off. It's the first thing I went after. Sorry about not listing it.

Jim,
I like to do all repairs myself, but still I sent my unit in and had
Uniden do it, and was very satisfied. Also I do want to say, even if you
haven't had the clock problem yet, you WILL. So you might as well suffer
not having it for a week or two and let them do their thing.

Yes, but only on Motorola units (and scanners of course).

Been a while since I programmed any LTR systems.

But, it sounds like you're programming it correctly based on what you
are describing. I would recommend one of the CSI eMail lists for help.

Note again that the first number 0/1 is arbitrary, the second is the
home REPEATER system and the third is the user ID...

It sounds like you're only able to adjust the user ID, when you need to
access all three.

http://www.espphotography.com/ltrchannels.jpg
http://www.espphotography.com/ltrrepeater.jpg

So in the repeater setup, I put in the frequencies, area and home channel.
In the Channel setup, the ID....

The home channel is your home channel, I think. IOW, it appears you can only have one. Same with the area code, although that would be the same system-wide anyway.

In short, it appears that is set up for single-users (with multiple IDs on the same home channel), and not ideal for a scanner or someone scanning multiple users.

From the programming guide:
"An LTR system sends digital data using low frequencies below 300 Hz. You have a choice of
using Inverted or Non-Inverted data."

I suspect a workaround for units with inverted
injection - very much like inverted DPL.

Or it might be from an engineer who doesn't know the protocol well.

But I caught that, too.

Joe M.

4721. time lag on proscan stream?

Yahoo group: BCD536HP
Date: 2017-04-24 03:59:26 UTC
From: Evan Platt
Topic: 4721 Message: 4721

So I know not directly related, but I'm using the Proscan on the 536 ... testing out my stream, so everything is local (ie I'm accessing the webserver via http://localhost:5000), same computer running the software. I'm seeing a delay of almost a minute for the audio streaming. Support with Proscan is great, but thought I'd ask first here, any suggestions of what to change?

Thanks :) (I can grant access to the feed if someone wants to test)...

4722. Re: [BCD536HP] Re: Discrimnator tap question

Yahoo group: BCD536HP
Date: 2017-04-24 04:16:32 UTC
From: Evan Platt
Topic: 4689 Message: 4722

So can I not get discriminator audio on a trunked conversation? So my understanding - does the 536 have two 'receivers'? One monitors the control channel, and the other the voice channel? When I listen to the discriminator audio on trunking, I hear data....

The software listening to the discriminator-tapped audio is responsible for decoding the data stream and determining what to do with it. The software, just like the scanner, should not send the data channel audio to the speaker but instead monitor it for channel grants etc.

If you're just going to the audio amp directly off the discriminator tap you will not have squelch, CTCSS/DCS tone-squelch) or automatic muting of data. This is to be expected as you're pulling audio directly off the receiver before the point at which the scanner filters it.

There is only one receiver. It switches between
the control channel and the voice channels.

Interesting question. Are you hearing data on a voice call on an analog system? In a P25 system you will hear data on the voice channel as well.

The 536 and all other scanners have only ONE receiver. This one receiver does a lot of work.

The receiver has the capability to detect audio from AM and FM transmissions from conventional (non-trunked) and trunked analog sources as well as decoding digital transmissions in specific formats, currently P25 and optionally DMR and EDACS ProVoice. Very high end scanning receivers (AOR for example) add the capability to detect Single Sideband transmissions and usually receive over a wider frequency range.

Digital systems that these scanners can receiver are variations of FM signals. Instead of using an audio signal to modulate the carrier signal, the digital transmissions are in the form of a carrier signal that is moved to differing offsets from the channel center in a specific pattern. These offsets and the overall pattern of shifting the carrier signal inside the assigned frequency spectrum is what we refer to as digital modulation.

The actual process, which is quite interesting, takes audio from the transmitting radio microphone and converts it into a digital bitstream in the transmitting radio. The reversal of the process at the receiving radio generates the locally produced speaker audio from the recovered digital data. Our scanner must also decode these data signals to locally generate the audio that we can hear when listening to digital transmissions.

Since a scanner radio such as the 536 is produced with the ability to decode and follow multiple analog and digital trunking formats as well as conventional signals, there may be more than one method of detecting and recovering the audio or digital signal. Since scanner manufacturers such as Uniden usually do not publish schematics of their products we often can only make educated guesses as to how the process is being done.

In all scanners, regardless of digital or analog, the basic design is a variation of the typical superhetrodyne receiver that has been in use for many years. The incoming RF signal (digital or analog) is first sent through a stage that may amplify and filter the signal. It is then sent to a mixer stage where the incoming signal mixes with a locally produced carrier signal. This mixer stage produces a sum and a difference output of the two signals. Typically the difference output of the two signals is then fed to an Intermediate Frequency (IF) stage that filters and amplifies the signal. There may be a second or third stage of mixing and down-converting of the signal in this IF stage. The output of the IF stage is sent to a detector stage. From the detector stage analog audio is sent to the audio amplifier and speaker, while digital signals have to be sent to a digital to analog conversion stage

to turn the recovered data signals into analog audio that we can understand.

The detector stage prior to any filtering or squelch action is where a "discriminator tap" signal is usually taken. The signal is simply an unfiltered, unsquelched audio signal that can be fed to an external device. Some high end scanning receivers may also include an output of the IF stage signal (an "IF tap") for connection to external equipment. This IF output is a low frequency RF signal.

To follow a digital trunking system the 536 scanner needs to listen to the signalling that the trunking system uses to control the subscriber radios. This control signalling is what allows the system to function. Once the scanner detects and decodes the control signalling it can follow the system and either output audio for whatever non-encrypted signals it decodes (ID SEARCH) or specific talkgroups (ID SCAN).

For a single trunking system the simplified receiving sequence is:
1) scan for a control channel (these are the red and blue channels listed on Radio Reference)
2) decode and listen to the control signalling frame (this is where the active talkgroups and the channels they are using are broadcast)
3a) If in ID SEARCH mode, switch to the channel for the first detected talkgroup; turn on audio amplifier and output audio unless signal is encrypted. OR
3b) If in ID SCAN mode, match talkgroup ID to list of valid talkgroups and switch to channel in use by valid talkgroup, turn on the audio amplifier and output audio unless signal is encrypted.

I hope this helps you to understand a bit more about your scanner and digital transmissions.

Topic: 4727 Message: 4727

I appreciate sincerely all the input, descriptions and time taken to answer the queries on this forum. Having had scanners going back to the 1970's when we had to order crystals for specific frequencies we wanted to monitor, and avoiding a channel was pressing that channel's individual button on the front, seems like you almost have to be an electrical engineer to work these modern marvels. This ain't your grandpa's scanner, as they use to say (paraphrasing). Thanks to all the "electrical engineers" out there taking the time to explain, in layman's terms, answers to the questions and concerns.

Tim

Ahh. Darn. What I'm doing is using ProScan to record, and using the WiFi audio. Was kind of hoping to maybe use the discriminator tap audio, but sounds like that won't work on digital / trunking.

No the best you can get is audio (or a panadapter view) from the
discriminator. The decoding of digital is further downstream.

It used to be so very simple. I have years of experience programming Motorola trunked radios, yet I was not prepared for the BCD536HP. In a sense, after you update the scanner firmware and the database, nearly everything is turned on and the new mission is to build favorites lists and turn off all the excess.

I just got my 536 Friday of last week. and is there a software that can change rebanding
I have a frequency of 771.909375 and I have put this in and it will not take. this is one of our main
frequency for our county here in ohio. but when I put it in it turn out to 771.905000. I am using ASC536
and it will not take but up above the frequency I have 771.9065625 that ok but it will not take
771.909375 any one can help...

Gary WW8O

ps my radio shack pro 652 work great on that frequency. right I thanking on send it back the bcd536 hp
because the pro 652 work better than the bear cat. it is faster and work better. but I here this the best but for
me I have to see right now my pro is better.

Change the bandplan settings in the scanner to 6.25 kHz for that band.

Still, those frequencies don't look right. There should be 5 decimal
places at the most and you have 7. I know of nothing that specifies
frequencies to the half of one Hertz short of maybe the ATSC (DTV) spec.

BTW, rebanding only affects 851-869 MHz (and the inputs 45 MHz lower).
700 MHz has nothing to do with rebanding.

Correction - make that 6 decimal places. (still not 7)

On the original issue changing the bandplan
for 700 MHz to 6.25 kHz should solve the issue.

771.9065625 is not a valid frequency. No one in radio land specifies a frequency down to 1/2 of 1 hz. Please post a link referenced to the system you are trying to program.

... I think rebanding has nothing to do with what ails your setup.

And the frequency you mention which gets rounded off doesn't look right either... unless it's at the end of the band and that's where it defaults to. It's also my understanding the only time the FCC will permit assigning frequencies between two "normal" assignments (or close to another) is when the adjacent applications have filed in a manner that would allow for it. This makes me wonder about that Ohio spectrum allocations-must be very crowded out there!

My local fire department was bothered by a new applicant who was allowed a frequency assignment as close to their frequency as the FCC would permit. As it turned out, too close. At my request, (I was the guy who suggested the VHF high band repeater system that was being interfered with) an independent consultant was hired and he learned the FD's application had been miss-filed, (not my doing) allowing for this to occur. (Interesting to note the old adage "Last on First off" was not enforced as the problem was rectified with the newer service re-aiming their directional antenna array, satisfying all. The offending signal causing the interference was just strong enough to be inserted at some stage within the FD transmitter, causing it to key up.) Wether the FD amended their application or not, where this won't happen again is unknown.

What service are you trying to enter? I'd like to check RR just to see how the frequencies are listed.

Bill

4740. frequency

Yahoo group: BCD536HP
Date: 2017-04-27 19:10:22 UTC
From: ww8o@...
Topic: 4740 Message: 4740

is some of the frequency that we have in ohio.. my pro 652 work great but not the 536 some help
some of these are on the list but some will not go into the scanner.

Topic: 4740 Message: 4741

Try 771.99375. That's the most likely correct frequency.

The one listed is clearly typo'ed.

4742. Re: [BCD536HP] frequency

Yahoo group: BCD536HP
Date: 2017-04-27 20:25:56 UTC
From: MCH
Topic: 4740 Message: 4742

BTW, you will be able to tell if it's correct if you get control channel data on the frequency. A difference if 90 kHz or so is the difference between reception and none. This is provided you're in range.

What's the URL you see that on? I'm looking at
http://www.radioreference.com/apps/db/?sid=6643 and don't see
771.909325c anywhere
on that page.

4746. Some QUESTIONS before Purchasing the BCD536HP

Yahoo group: BCD536HP
Date: 2017-04-28 17:19:18 UTC
From: Ray Ray
Topic: 4746 Message: 4746

Hello, I am sort of new to this group. Maybe a year.

Just reading the post on the group about the 536HP over this period of time.

I have a few questions if someone could answer them please?

Where would the best place to purchase from?

Does this scanner receive ProVoice without having to have updates?

Should I also purchase the extended warranty from whomever I purchase it from?

Do I need to have it setup from the place I purchase from and pay that fee, or is it as simple as inputting your zip code

And it downloads everything like 800Mhz, 700MHz PII Digital. Etc.;

Do I net to purchase anything else in order to receive the P25 ProVoice?

To your best of knowledge has all of those little bugs been fixed in the later models of this radio that is sold over the internet?

I am not want to start an argument in this group about who is or who is not the best place to purchase from.

I am asking because of your experience with the radio and different sellers!

Thank you in advance for your answers and help.

Have a Blessed Day!

Thomas

There are a number of places that sell them. The "best" depends on
preferences you have not stated (price, customer service, location, etc)

> *Does this scanner receive ProVoice without having to have updates?*

You have to purchase the ProVoice key. Whether or not an update is
required depends on how new your unit is.

> *Should I also purchase the extended warranty from whomever I purchase
> it from?*

I've personally never found extended warranties to be worth it, but
again that is a decision only you can answer.

> *Do I need to have it setup from the place I purchase from and pay that
> fee, or is it as simple as inputting your zip code*

You can enter your zip code. You will also want to set the Range and
select the Service Types you want to receive. None of this is difficult.

> *And it downloads everything like 800Mhz, 700MHz PII Digital. Etc.; *

Again, this depends on how new your data is. Updating is only a matter
of installing Sentinel, connecting your scanner, and clicking UPDATE
then UPDATE HPdB database.

> *Do I net to purchase anything else in order to receive the P25 ProVoice? *

There is no such thing as P25 Provoice much like there is no such thing
as a Ford Chevy.

> *To your best of knowledge has all of those little bugs been fixed in
> the later models of this radio that is sold over the internet?*

Yes. ("later" being within the past few months or so)

Joe M.

Best place to purchase? Whoever gives you the best price and service you require.

ProVoice is a digital voice system used with EDACS type trunking. It is not included but can be enabled by purchasing a key from Uniden.

I would not purchase an extended warranty. Uniden is very good about repairing these things (even out of warranty) and like most electronics, if it lasts the first 90 days it'll probably last for many years.

Do not pay for setup unless you are too lazy to learn to use it yourself. Even if you pay for setup you will probably be disappointed because only you know exactly what you want to hear. Learn to use it and do it yourself. You'll be much happier in the long run.

Yes, it receives EVERYTHING that is in the RadioReference.com databases for the frequencies in the scanner's specifications and does several types of trunking and P25 digital voice without upgrades. If you want Provoice and/or DMR (MotoTRBO) then you need to purchase upgrade keys for them.

By the time there are zero bugs left in any programmable device, it's obsolete. But 99.9% of the bugs are already fixed.

I prefer local places where you can see and touch the scanner before buying but you will usually pay a premium for that ability. Ham Radio Outlet is not the cheapest but they keep them in stock and will show you the unit (and may have one on display). Places like Scanner Master are great for online purchases but you can't really visit their shop and test drive one.

I've personally never found extended warranties to be worth it, but again that is a decision only you can answer.

> *Do I need to have it setup from the place I purchase from and pay that
> fee, or is it as simple as inputting your zip code*

You can enter your zip code. You will also want to set the Range and
select the Service Types you want to receive. None of this is difficult.

> *And it downloads everything like 800Mhz, 700MHz PII Digital. Etc.; *

Again, this depends on how new your data is. Updating is only a matter
of installing Sentinel, connecting your scanner, and clicking UPDATE
then UPDATE HPdB database.

> *Do I net to purchase anything else in order to receive the P25 ProVoice?
*

There is no such thing as P25 Provoice much like there is no such thing
as a Ford Chevy.

> *To your best of knowledge has all of those little bugs been fixed in
> the later models of this radio that is sold over the internet?*

Yes. ("later" being within the past few months or so)

Topic: 4740 Message: 4750

I am trying to add 771.909375 it is one of our new frequency here in Scioto County Ohio. When the switch over to 700 MHz the frequency on

http://www.radioreference.com/ is not always wright.. they still have on police on 463.02500 and they have not been on that for over two years also all the old frequency 33.5800 33..7800 it has been many years since they use them….I work with marks radio every day and so I keep up with the new frequency.. here in Ohio… when the cut of year 3013 here the frequency keep changing on here ow 776.90625 it show in black but it is working right and is one of the main tower here. Here is what I like to know I use arc536 software and when I add the 776.909375 is change to 776.50000 but in my pro 652 is work great and thank I did check band with 6.25 and try 5.000 not any help Gary WW8O..

Topic: 4740 Message: 4751

As was mentioned on this list over the past 24 hours, that is most
likely a typo. Try a frequency of 771.99375 IF the original frequency is
at all close. You will need to make sure the bandplan is 6.25 kHz.

It could be that the database somehow completely changed that frequency.

4752. Re: [BCD536HP] frequency

Yahoo group: BCD536HP
Date: 2017-04-28 22:22:52 UTC
From: Uniden UPMan
Topic: 4740 Message: 4752

776.909375 is not a valid frequency. Valid frequencies are at 6.25 kHz (0.006250 MHz) spacing. The closest valid frequency is 776.90625, but as Joe mentioned, the most likely frequency based on what you've been saying 776.99375 (assuming the "0" in the middle of the frequency is a typo). When I put 776.909375 in ARC XT, it changed it to 776.9050 MHz (not 776.5 MHz).
Also, RadioReference has no police listing for Scioto County on 463.02500 MHz.
The frequency in RadioReference of 771.73125 MHz is both reasonable and a valid frequency (i.e. it falls on a 6.25 KHz step). It is also a frequency that is specifically listed on the FCC's page for that site license as a frequency associated with that site. All things considered, I'd personally tend toward using RadioReference/FCC as a valid frequency rather than the frequency on the listing you posted.

Well - right out of the FCC
http://wireless2.fcc.gov/UlsApp/UlsSearch/searchGeographic.jsp

You can select
Include Mobile
Ohio
Scioto county
Select a range of 771 to 772 mHz
And there are 4 systems that meet that criteria.
None of them have that frequency.

4754. Re: [BCD536HP] frequency

Yahoo group: BCD536HP
Date: 2017-04-28 22:37:30 UTC
From: MCH
Topic: 4740 Message: 4754

I checked all of 750-800 MHz, and there is nothing close that matches.

Maybe someone just wanted to see how gullible a RR admin is.
(which is a change, as usually valid data is rejected by many of them)

Joe M.

Topic: 4740 Message: 4755

Gary, can you take a picture of your Pro 652 when it is locked on this frequency and post it here so those “in the know” can see what the display is showing?

Thanks!

Tim

look inside photo I put the pic in there off my pro 652. I am sorry I ask abut trying to put frequency in the bcd536 hp..

ray said I need to drop this and I am sorry I ask but when you buy a scanner some time you need help..
but $500.00 is something I can not buy everyday when you retired and end joy radio I have been a ham 49 years and seen and work on all kind of radio. so I will not ask again this is a picture of my scanner...

some has been helpful and I will thank you. just like to know what software is the best to program with.

Since the pic is showing activity, try 771.90625 MHz or
771.90125 MHz which are the closest valid frequencies.

Only if you duplicate it.

Or you can make it a separate one that can
be enabled with either of the two SQKs.

Just thought of duplicating it after I hit send.. but would prefer to not have to that way if I make a change - add talkgroup, etc, I only have to do it once - What do you mean by make it a seperate one that can be enabled with either SQK?

I only see one choice for SQK?

Put it on a separate SQK of its own that can be enabled at the same time
you enable either of the two SQKs you're talking about.

I.E. If your query SQKs are 1 and 2, put this System on 9 then just hit
1 ENTER 9 ENTER or 2 ENTER 9 ENTER. (or just enable 1 and disable 2 and
keep 9 active)

4767. different sites when holding a channel

Yahoo group: BCD536HP
Date: 2017-05-08 02:31:04 UTC
From: Evan Platt
Topic: 4767 Message: 4767

So I'm seeing something odd with my 536. When holding on a channel, I often miss conversations. Full signal bars, sitting with another scanner right next to it receiving the missed calls.

So here's my potential observation, and maybe a issue....

Is the 536 scanning all sites when it's locked on a channel?

If I'm scanning just the system, I see it rotating through each site. Is it still doing that in the background if I'm holding on a channel?

4768. Re: different sites when holding a channel

Yahoo group: BCD536HP

From: Bill Nolan
Topic: 4767 Message: 4768

You are trying to listen to a trunked system, right?

Try this;

Instead of locking it down on a channel, lock it down on the Department or System. That should fix it.

Bill

Yea... Hmm... Thinking...

What I told you probably won't fix it Evan. After thinking about it I'm pretty sure when the channel button locks down a channel the scanner should track whatever talk-group you have assigned to that channel, regardless of what site is being used to collect the signal and pass it along.

Are you sure both radios, (the one in question and the other used for comparison) are loaded with the same exact system info?

I'm curious, what service are you listening to? What channel do you want to lock down?

It's one specific fire channel on the EBRCS system. Other device is a Unication G5 pager.

Make a fave list with only those talkgroups. Then set priorities.

How many sites are within the System?

I think the way the scanner holds a channel is that it holds the Site with it where the activity was monitored. There are two ways of "holding a TG", and Uniden chose the way that is different than what you would choose, but your way (scanning sites while holding one TG) could miss activity, too. Fortunately, there is a way to do either (the first method below).

If you want to still scan a System but monitor one channel, you will have to program a Department with that one channel in it then hold that Department or monitor that one channel on the active site. I believe those are the only two options. Well, I guess you could also program a FL with one channel then simply reprogram that one TG to the one you want to "hold". That would be three ways.

8 sites...

https://www.radioreference.com/apps/db/?sid=5317
But that's just one system.

So the issue is - and many departments operate this way - is like the fire department may have 15 TAC channels. I'd want to be able to hold on any random one - depending on what channel an incident is workign.

I guess the question is: Why is your system changing sites so often? The only time you should lose activity on the active site is if ALL units de-affiliare from it (and provided it's not an 'always-affiliated' TG). That should be fairly rare.

But, either of the two methods I mentioned should work. I've nearly always found a simple channel-hold to work, but I guess my system does not change sites as often. But, it also covers 75% of the county, so it's rare for there to not be a unit on that site.

Are you sure you're not seeing simulcast interference?

Hi folks,
Chiming in here...
The 536 does not necessarily hold on a talkgroup and the site the talkgroup was last heard on.
Evan wants to hold on a talkgroup and let the scanner decide which site is best for the scanner RF wise.This was my inquiry a while back.I was hoping the 536 holding on a particular talkgroup would make the scanner hold on a particular site, as well, as long as the signal strength permits it. When the RF drops off, the scanner hunts for another control channel of the system.
After the radio hunted and found a usable control channel, that corresponding site may not particularly have a radio tuned to the scanner's talkgroup. When this is the case nothing is heard from the scanner.
The 396 does this well. And I hoped Paul would bring a firmware update allowing the 536 to do the same.The best my eyes tell me is when a talkgroup is held on the 536, it continues to scan all frequencies programmed to be with that system looking for traffic of the talkgroup the 536 is held on. I find that a pseudo CC Only Search function.I'm going out on a limb here and Paul is gonna drop his drawers and fire a couple of rockets at me when I say 'the 396 does the above better than the 536'.I own both and the 396 does CConly search closer to the smartnet spec than does the 536. This layman's opinion is that the logic ladder of the 536 is not the same as the 396 for this function.Firmware updates can fix this.The 396 behaves closer to what a service radio would do when dialed to a specific talkgroup.The only thing the 396 doesn't mimic a service radio's behaviour is transmit an affiliation to the site causing the master controller to route the service radio's talkgroup to the radio. But then these scanners are decoders, not transmitters.One way or another...great radios Paul and company!
I have not been completely successful mimicking the 396s logic with programming on the 536.That's another conversation.
Best Wishes Everyone!
Joey

I posted two ways to accomplish that.

The flaw in your method (holding the site until it is out of range, then finding another) is that there is no guarantee the TG of interest will be carried on that new Site - in which case you will be scanning nothing (the original complaint - or so it seems). Of course, you mentioned that. I was just pointing out that either method has pitfalls.

I think the x36 does hold the site the TG was heard on - at least giving a reasonable expectation that activity would continue to be heard without the delays of scanning other sites (an 8-16 second delay of reception in his case). But, as I mentioned, there are ways of doing that without a firmware update.

One thing I wish the x36 had that it does not - a dedicated SITE HOLD button. (not that I would want to give up any of the other three!) That would give easier access to either scheme - scanning Sites or holding on the Site that was carrying the TG activity.

Hi Joe!
Absolutely right!Given is the 536 holding on a particular talkgroup.What the 536 does now is scan all control channels of the system in question looking for traffic of the talkgroup in question.A good idea, but, I find the 536 frequently misses the talkgroup's traffic while doing this.I have compared the 396's behaviour with the 536 and the 396 has scanned to a control channel with the talkgroup traffic whilst the 536 has continually missed it.The 396 has scanned to a control channel with sufficient signal strength but no traffic of the talkgroup as well, mind you.
At least I the user can observe the scanner locked on the particular control channel.That is why I wish the 536 would behave the same as the 396.I have no explanation for this behaviour of the 536 as the RF strength of the new control channel was ample for decoding.The 536 completely missed it but seemed to acknowledge the strength of the control channel first then moved on.BTW I use Ontario's Fleetnet Zone 1 as my reference.
Something tells me a close look at the ladder logic and flowchart of that particular portion of the firmware will show the difference. I do acknowledge, though, the scanner now searching all control channels of the system looking for that talkgroup's traffic. Why it did not stop on the control channel with the traffic, I don't know. Still does it today.
You're not gonna let me get any sleep are you! Teehee.
Joey

Definitely burning the midnight oil, but not related to scanner-land.

My day (in brief) has been spent largely looking for something that two major office supply stores carry (three if you count OfficeMax and Office Depot separately), but both they and the manufacturer are out of stock nation-wide. I have some other leads, but they are not moving as fast as I would like.

Of course, this comes after calling one of the stores and being told they have stock only to get there and find that they were talking about the wrong model after I specified their SKU number. I have four of the old ones - I need one newer one. (imagine asking for a BCD536HP and they have BCD996XTs)

So, not the best day. Regardless, this will likely be my last post for several hours (yea - I can hear the cheers on that one!)

Oh, and the Penguins blew another game. Bad time for a slump.

I don't think the system is changing sites - I'm sort of in the middle of a lot of the sites. Is it possible I'm locking onto a site that isn't broadcasting that talkgroup ?

Yes, that is possible. Try to hold the channel while it is active so the
site is known to carry it (at least at that time).

Again, as far as I know, the only way one can 'force' the x36 into hearing only one talkgroup on multiple sites, is to make a fave list with ONLY that talkgroup allowed. When not 'talking', it will scan the available sites, then if that TG appears, you'd hear the audio, irregardless of which site. If one (or more) site/s are not affiliated with that TG, it would take a couple seconds to know that, so the scanner might miss some traffic.

If the scanner is NOT moving about, then one could edit out the sites that wouldn't be useful (too far away for example) which would speed up the scanning circle (effectively locking it to 1-X sites). Some careful editing would be useful (allow ONLY the site one could hear where the affiliation is ALWAYS there), again best kept within one fave list so the rest of the system could be scanned normally, if desired.

It's an imperfect solution for an imperfect system and the only way to do better is to obtain a radio that allows one to be affiliated (get a legit system radio, starting at $1k).

I don't find this a flaw in the scanner since it's near impossible to allow for all situations and wanting only one TG of hundreds (on that network) is likely rare.

4787. Discovery Mode Error

Yahoo group: BCD536HP
Date: 2017-05-12 10:53:46 UTC
From: tanger32au@...
Topic: 4787 Message: 4787

Has anybody else come across this:

Running in discovery mode against a 800MHz EDACS trunking system, when reviewing the results you have hits logged for talkgroup 00-000, when you try and review these and play the audio the scanner shows a SD card error and won't do anything until a battery is removed.

4791. Upgrade 536HP Firmware or not?

Yahoo group: BCD536HP
Date: 2017-05-29 05:18:44 UTC
From: rhyolite@...
Topic: 4791 Message: 4791

I have BCD536HP_V1_11_23 running and it is apparently 7 versions old. I am not using DMR or ProVoice, P25 Phase 1 and 2 only.

Any compelling reason I should upgrade my firmware at this time?

Only you can decide. It depends on the type of systems you are monitoring and how you are using the scanner. Look at the Release Notes in this link.

1-11-20 (TWENTY) is the "current version" according to the "upgrade firmware" choice in Sentinel.

Not sure how to get a newer version than the software will allow.

4800. How to Force Firmware Upgrade?

Yahoo group: BCD536HP
Date: 2017-05-30 15:50:34 UTC
From: m-p_l@...
Topic: 4800 Message: 4800

Due to a USB cabling problem (now resolved), I DL'd the latest FW from here (1.11.30) and put it in the Firmware folder on the SD card, inserted it in my BCD536HP and it updated just fine. I also own the BCD436HP and did the same . . . it will not update.

After solving my cabling problem, I used Sentinel and tried installing the FW from the website . . . no joy, it claims that the 436 is up to date with FW 1.11.20!!

How can I force an update? From the SD chip or Sentinel?

Thanks.
Len

" no joy, it claims that the 436 is up to date with FW 1.11.20!!"
Thats because FW 1.11.20 is the latest Official firmware.
21 thorugh 30 are beta updates that UPMan has released for people to test.

As others have mentioned make sure you put the correct firmware in the
firmware folder and power off the unit.

Thank You!!

Right you are, I had DL'd the 536 FW and the radio was smart enough to ignore it. <LOL>

Each radio has its own SD card.

I now DL'd the 1.11.30 FW for the 436 and it installed just fine.

Again, thanks for the help. I should have known better.

4806. Re: [BCD536HP] How to Force Firmware Upgrade?

Yahoo group: BCD536HP
Date: 2017-05-30 18:03:59 UTC
From: Patrick
Topic: 4800 Message: 4806

Those links came from UPMan probably from the discussion on RadioReference forums.
I like many others are using .30 firmware to help uniden test different revisions of firmware to help with DMR issues.

Some have noted P25 Phase 2 improvements as a positive side effect.

Now that the OP has put the proper firmware in the proper location (536 for the 536 and 436 for the 436) he has got the update installed.

If he wants to go back the Sentinel software should put it back to .20 which was the latest official release. If he wishes to.

4807. Reception Question

Yahoo group: BCD536HP
Date: 2017-05-30 18:41:29 UTC
From: TLFerg53
Topic: 4807 Message: 4807

This is a question not pertaining to firmware updates but to a reception problem with a FD on a 536.

Here’s the somewhat frustrating issue: I have Jefferson FPD (Jefferson County, IL) programmed using the RR database, frequency 154.430 (analog) and the reception is horrible to say the least, a lot of static and you can barely hear what the base is saying through the noise as if they are a million miles away, yet, the Jefferson County Sheriff’s Office (Jefferson SO), when talking to the FPD and units, comes in fine and understandable.

The only thing I can figure out is there is something between the Jefferson FPD station and my home blocking the transmission possibly? We are about 18 miles away as the crow flies to the northwest. In my vehicle, on a 436, the station comes in fine in most areas of town, it just appears to be at home on the 536 connected to an outdoor antenna up about 35 feet on a 40-foot tower. Even changed antennas and ran new coax with no difference.

Any ideas or suggestions would be appreciated.

Tim

Sounds like your antenna is just in a null (bad spot) for the Jefferson
FPD Base.

Replacing the antenna would likely not help. Try a different location
for the antenna. Even moving it a few feet could make all the difference.

What happens if you connect the 436 to the home antenna? If there is a vast difference, your 536 may have suffered a failure. One of mine went completely deaf, no known cause but a quick trip to the mother ship and back, it's as good as new.

Hadn't thought about connecting the 436 to the antenna to see if there's a difference, will do that.

Had the same result when the original antenna was on the other end of the house, only at roof top level.

Also make sure the attenuator isn't enabled on the 536.

And although it's not a likely cause, check the modulation setting.

Not really! The links were to the files section of this group. The files MAY have come from Uniden, but the links were not back to a Uniden site. Can you verify that the files were not altered after they were first downloaded from Uniden? This is just a caution that all should consider when downloading anything.

Dewey

I am the OP with BCD536HP_V1_11_23 installed. If I understand correctly fro the uniden TWIKI page 1.11.20 is the current release so I am already in a BETA?

I used Sentinel to get the version I have, back in December 2016.

Is there a compelling reason to use one of the later versions if I am not using DMR??

I didnt post the links so i cant verify it.
I see where your going with it and i wont argue with the logic, its good to be safe.

If your worried about the authenticity get the updates from the RadioReference forum where UPMan is posting them.

Those are unofficial being released by UPMan to get feed back for DMR issues Uniden is trying to make better.
As people give feedback they are making tweaks and thats why there have been so many.

The "official" relaease of 1/11/20 that came through Sentinel did not get P2 working on my new 536. I was deaf to the local P25 P2 system until the Beta release of 1.11.23. 1.11. 22 did not work.

These may be unofficial releases, but my 536 would have been a $$$ paperweight without them.

Now, if they can just tweak or give us control over the tone to get rid of the muddy excessive bass.

Assuming your "D drive" is your scanner, once the scanner uses the files, it erases them, so you won't see the .20 files there (or any other BIN files for that model).

4824. FOR SALE 536 with DMR and ProVoice Key - RTC Fix - very low milage

Yahoo group: BCD536HP
Date: 2017-06-04 05:08:31 UTC
From: radiotronic@...
Topic: 4824 Message: 4824

I give up. Not enough time in the world to figure out how to use this the way I want. Just to make sure that working for Harris for 25 years hadn't completely scrambled my brains, I bought a whistler TRX-2 - opened it up, threw away the manual, and by the end of the day it was dancing for me and washing the dishes.

SO, my stupidity can be YOUR gain.

I am offering a BCD536HP with very low usage - i would say it is like new, but there are a few very minor scratches on the top - because i am a slob and stack radios on top of each other, they fall over etc. but the face is clear with NO scratches, front panel as well and brand new looking as is everything else.

I had the RTC update and display fix done by uniden.
I Have the DMR and the PRO VOICE keys programmed (and will include the keys on a cd)
all original accessories - none ever used - I use my home 13.8 volt distribution system for power (so the wall wart and the car wires are still in their orig bag). It has NEVER been installed in a car, just on my bench.

I never unwrapped the WiFi module, so it is factory new still.

I have 2 telescopic antennas to toss in - a bnc mount, and a bnc 'push on'.

Also included, is BUTEL ARC536x with the two keys you need to activate it - install and keys included on CD. life time upgrades free, you can use Sentinal to program it or the BuTEL ARC prgm
- but the BUTEL ALSO does the real time display - i have 4 monitors on a tree 2x2 and one is nothing but scanner screens - you can have as many instantiations of ARCXT PRO or other running at the same time, so i have 4 for my P2s and the one for the 536 , which i stopped bringing up months ago. and a few for my 15XTs -- got about 8 of them, yeah i know i know - they are going on ebay next week as well.i'll keep one because I know it inside and out. but I am in love with the 996p2s and am starting to fall for the TRX-2 -- still think the uniden's are better at this point.

The only thing I do NOT have is a the manual - I declared my house paper free 10 years ago -- scan it and toss it. But, for the radio, i have the latest PDF (also on the CD) and if you want that printed out, i can do that for you 110 pages.. space and weight.

Price:
NEW (What I Paid)
amazon lowest price: $510
arc536pro $ 69.95
PRO VOICE $ 65
DMR $ 50 total $699.95

I WILL SELL IT TO ANYONE IN THIS GROUP FOR $450.00. - the whole package priority mail CONUS Free - in a few days, if no one bites, i'll but it up on ebay. and for this group only, if

you don't like it , you can send it back and get your money back within 7 days of mailing. email me first.

If you want photos, email me at radiotronic@radiotronicgizmo.com and i'll give you all the shots.

I take paypal (add 3%) = and ship it priority no later than the next day -- original box.

gonna buy another trx-2

cheers

Just curious why entering the zip code, range, and
setting the service types didn't work for you.

SO, my stupidity can be YOUR gain.
I am offering a BCD536HP with very low usage - i would say it is like new, but there are a few very minor scratches on the top - because i am a slob and stack radios on top of each other, they fall over etc. but the face is clear with NO scratches, front panel as well and brand new looking as is everything else.
I had the RTC update and display fix done by uniden.I Have the DMR and the PRO VOICE keys programmed (and will include the keys on a cd)all original accessories - none ever used - I use my home 13.8 volt distribution system for power (so the wall wart and the car wires are still in their orig bag). It has NEVER been installed in a car, just on my bench.
I never unwrapped the WiFi module, so it is factory new still.
I have 2 telescopic antennas to toss in - a bnc mount, and a bnc 'push on'.
Also included, is BUTEL ARC536x with the two keys you need to activate it - install and keys included on CD. life time upgrades free, you can use Sentinal to program it or the BuTEL ARC prgm - but the BUTEL ALSO does the real time display - i have 4 monitors on a tree 2x2 and one is nothing but scanner screens - you can have as many instantiations of ARCXT PRO or other running at the same time, so i have 4 for my P2s and the one for the 536, which i stopped bringing up months ago. and a few for my 15XTs -- got about 8 of them, yeah i know i know - they are going on ebay next week as well.i'll keep one because I know it inside and out. but I am in love with the 996p2s and am starting to fall for the TRX-2 -- still think the uniden's are better at this point.

Brevard county, Fla – has an EDACS systems. 5 towers all simulcast. They breakdown services very nicely. 09-xxxx is Palm Bay (where I live), 01-xxx is Brevard country, etc.

Then the xxx's are broken down in groups for police, fire, etc.

With the 996P2 and the TRX-2 -- I program in the 3 tower groups (north, south, and beach), and I then use the top level quick key 1 for Police, 2 for Fire, 3 for Air, 4 for Conventional, 5 for Ham, etc

And then the sub-keys (select 1 for police) I can select 1 for palm bay PD, 2 for Brevard county Sherrifs dept, 3 for Melbourne, 4 for cocoa beach, etc. same for fire.

For the non trunking , the 'sub' keys are used differently.

If a dummy enters my zip code and selects service types (range of 10 miles will get me all 9 cities) -- there is no easy way to select PALM BAY PD. In fact, I could never figure out how to use the front panel to select any favorite list easily – somehow I always got stuck with some blip. 1 ? or something and nothing would work until I cycled power.

Yes, everyone here can do it. Yup, can be done. Zip code and service type is like the worst possible way to program a scanner IMHO and have any selective listening. Anyway. Don't want to start a discussion on how I can jump through hoops to get it to do what the 996p2's do or the TRX-2 does --- I am sure it can do it the same -- just saying the others are VERY easy to figure out and program in a logical order. Just couldn't figure it out with the HP.

Sold it now – and is no longer a problem for me.

You did hit on the key: Zip code entry is not a replacement for custom programming such as that you do on your other scanners. But, custom programming is possible just the same as it is on your other scanners. The only difference is that you create the FL(s), Systems, Departments (and Sites if applicable), and Channels. You also have much more flexibility since you have multiple FLs to setup different configurations which you don't have on your other scanners (the FL is one step above the top level of your others).

It's not any more difficult - just a little bit different. You worked for Harris. Likely Motorola SW would seem like it's excessively difficult for you. I know it was that way when I learned Motorola SW when I was used to GE (the forerunner of Harris). Then learning scanner trunking terms was different yet again. Nothing is ever "intuitive" when you talk about different languages. Just because you know English well does not mean you can read Japanese without learning it.

But, zip code programming will scan what you want to scan. It just won't set up the custom programming (the only difference really being adding the Quick Keys) to select the various agencies individually.

Just curious, and I apologize if this was answered somewhere along the line, why was it you bought the Uniden vs another Whistler?

Thanks,
Tim

Actually, the public service radio side of Harris was somewhat recently bought – Harris is a 100+ year old company – all our military radios are Harris built, as our satcom and digital broadcast, etc.. but the public service stuff, is a hobglobin of companies that Harris picked up – and I am not sure how long they will hold on to them IMHO – but I don't know much about them, they are up in Virginia visited them once – not many engineers – most stuff is outsourced. Harris is mostly in Florida.

And I agree with you on what is intuitive to one is not to the other based on our past experience which shapes our expectations.

You did hit on the key: Zip code entry is not a replacement for custom programming such as that you do on your other scanners. But, custom programming is possible just the same as it is on your other scanners. The only difference is that you create the FL(s), Systems, Departments (and Sites if applicable), and Channels. You also have much more flexibility since you have multiple FLs to setup different configurations which you don't have on your other scanners (the FL is one step above the top level of your others).

It's not any more difficult - just a little bit different. You worked for Harris. Likely Motorola SW would seem like it's excessively difficult for you. I know it was that way when I learned Motorola SW when I was used to GE (the forerunner of Harris). Then learning scanner trunking terms was different yet again. Nothing is ever "intuitive" when you talk about different languages. Just because you know English well does not mean you can read Japanese without learning it.

But, zip code programming will scan what you want to scan. It just won't set up the custom programming (the only difference really being adding the Quick Keys) to select the various agencies individually.

Ah – well, I am not qualified to compare the two. There are some negatives to the TRX-2 that Uniden does not have. And as well bashed about, I just couldn't get my head around the 536 when the TRX-2 seemed very intuitive.

Ford vs chevy.

Good hunting. And to answer your question directly: I have always bought uniden. First one in '75 with 8 channels using rocks (Crystals) – so it was a natural grab. The 536 threw me for a loop, so I decided to try the (what I think is fairly equivalent) TRX-2 and found it easier for me.

One of the best things about Uniden is BUTEL.NL – can't do scanners without the real time controls and easy programming.

R

Just curious, and I apologize if this was answered somewhere along the line, why was it you bought the Uniden vs another Whistler?

Thanks,

Tim

blockquote, div.yahoo_quoted { margin-left: 0 !important; border-left:1px #715FFA solid !important; padding-left:1ex !important; background-color:white !important; } What's a 535 worth now with out any upgrades ? I just can't bring my self to pay for upgrades that makes the scanner price well over 700$ when I can get a whistler for 500$ and it works great ! It's been repaired by uniden for the clock and display problem . It has the dongle

Brevard county, Fla – has an EDACS systems. 5 towers all simulcast. They breakdown services very nicely. 09-xxxx is Palm Bay (where I live), 01-xxx is Brevard country, etc.

Then the xxx's are broken down in groups for police, fire, etc.

With the 996P2 and the TRX-2 -- I program in the 3 tower groups (north, south, and beach), and I then use the top level quick key 1 for Police, 2 for Fire, 3 for Air, 4 for Conventional, 5 for Ham, etc

And then the sub-keys (select 1 for police) I can select 1 for palm bay PD, 2 for Brevard county Sherrifs dept, 3 for Melbourne, 4 for cocoa beach, etc. same for fire.

For the non trunking , the 'sub' keys are used differently.

If a dummy enters my zip code and selects service types (range of 10 miles will get me all 9 cities) -- there is no easy way to select PALM BAY PD. In fact, I could never figure out how to use the front panel to select any favorite list easily – somehow I always got stuck with some blip. 1 ? or something and nothing would work until I cycled power.

Yes, everyone here can do it. Yup, can be done. Zip code and service type is like the worst possible way to program a scanner IMHO and have any selective listening. Anyway. Don't want to start a discussion on how I can jump through hoops to get it to do what the 996p2's do or the TRX-2 does --- I am sure it can do it the same -- just saying the others are VERY easy to figure out and program in a logical order. Just couldn't figure it out with the HP.

Sold it now – and is no longer a problem for me.

4833. BCD 536HP Sentinel update problems:

Yahoo group: BCD536HP
Date: 2017-06-08 12:12:33 UTC
From: bunny@...
Topic: 4833 Message: 4833

BCD 536HP Sentinel update problems:

I have nowhere to turn. I have contacted Uniden by phone and emails over the past year and all they tell me is that my problem is Microsoft's. My computer is Windows 10 and updated to the max. I have contacted Microsoft—no replies. In troubleshooting my computer all I get is "program not compatible"???
I cannot get Sentinel Software to update in either section. All I get each time is a message that remote server returned Error 229 Extended Passive Mode Entered. It will not update. I have gone step by step through the attempted processes and nothing works.
If anyone could help or pass on to someone that can, I would deeply appreciate it. I don't know much about all this technical stuff and do need all the help I can get. I am 70 years old and love my scanner, but after all of these complicated problems and high costs, my next scanner just might be a Whistler.
Please contact me at my email address, I would greatly appreciate it. I'm not sure if I can find my way back to this page??? Uniden never heard of my problem and the 229 error is not in their lists.
Thanks very much,
Bill Dever

It might also be your ISP blocking things. Who do you have?

Do you have a friend whose PC you can try? (or do you have another PC?)

Blaming Uniden for an issue which is not theirs is hardly fair.
Put the blame on the right place. Your next OS should
not be Windows or your next ISP should not block ports.
(depending if the issue is Windows or your ISP)

I seriously doubt the issue is Sentinel since
so many others are using it successfully.

It's like blaming Chevy because your car won't
run right even though it has no fuel or tires.

Yes, there is an issue. Let's find out
who is to blame before pointing fingers.

Most likely, your firewall is blocking the Passive Mode transfer that Sentinel is trying to perform from the Uniden FTP site. Unfornately, there is no option to turn Passive mode off.

What version of Sentinel are you on? 1.07 (revision 5) is the latest.

If you need to update, download from the below link. Unzip and run the installer. You'll be up to date at that point.

If it is a firewall issue, you can try disabling it, update, then re-enable the firewall. This will work only if it's the firewall in your PC or in your router. If it's on the ISP end, you might be able to get them to do something, but likely not.

From Googling (I have never heard of that error, either), it looks like it would be an issue with your firewall or router. There is no one way to fix it (it depends on your ISP, router, etc.).

Try this (if the pic passes through):

If checked, uncheck it. If not, check it (should be checked in most cases).

4839. Re: [BCD536HP] BCD 536HP Sentinel update problems:

Yahoo group: BCD536HP
Date: 2017-06-08 18:08:08 UTC
From: Rick WA6NHC
Topic: 4833 Message: 4839

"Passive' defines which of the server-client relation determines ports for transfer etc. If you turn passive off (previous post, internet settings), it may work for you. If it does work while off and not ON, that indicates that some of the ports are being blocked (ISP, router, firewall, in that order). It also means that other transfers may not happen (pasv is used a LOT these days).

If it is the router, you can TEMPORARILY put your computer in the router "DMZ" to see if it works then. If that still fails, while set that way, turn the firewall OFF (temporary) and try again. That means your computer is wide open on the internet. If both settings still fail, contact your provider to see if any ports are blocked (should be NO ports blocked). Usually the port values (varies a LOT) are in the 50,000 range.

Remember to turn the firewall back on and take your computer out of the DMZ in the router (exposes it to too much problems, Windows can't handle the raw internet).

Can you upload that image to the FILES and/or PHOTOS section?
(especially if it fixes the issue)

click start; then type "internet options" to get the control panel
option, advanced tab, scroll about half way down...

"Use passive FTP (for firewall and DSL modem compatibility)"

Mine is checked, no issues.

I need a carrier indicate signal from my BCD536HP to start an external (hardware) recording device when the channel unmutes. I can't use VOX. Does this exist at the rear panel DB-9? If not where to find the signal inside the radio?

Thanks

The only place I can think of might be the audio amp.

Why can't you use the built-in recording?

No kidding about the need for a description. I got my P25 P2 working with 1.11.23 and have no desire to screw it up.

Now if Uniden does something about the muddy, heavy bass audio, then I am all over it.

4855. Re: [BCD536HP] New file uploaded to BCD536HP

Yahoo group: BCD536HP
Date: 2017-06-18 11:04:41 UTC
From: Bill Nolan
Topic: 602 Message: 4855

Kevin,

I didn't see any reference to the version 1.11.31 firmware mentioned in a recent post but there are notes (what the upgrade has corrected, added or subtracted and reasons for all previous firmware upgrades). That answers part of your inquiry.

I haven't researched this new firmware upgrade as yet, wondering why it's not yet listed in the TWiki page from UPMan. But I'll give it a week or so and check back.

Going to RadioReference.com and looking at both Forums and TWiki pages will give you a lot of insight and provide a jumping off point towards learning more. (If you want to post something there, you must register and sign in-an additional requirement within RR. Look to the top right of the Forums or TWiki page and just down a bit for where to do this.)

Paul Opitz (also known as "UPMan") is the Gentleman who heads up Uniden's scanner division. He posts to the Forums and TWiki pages as he determines necessary. He also has produced videos about the different scanners which you may have seen-informative to say the least... and a nice marketing touch for Uniden. Search utube for Uniden or UPMan.

But the reason for THIS post is to help those who are new to scanning, or new to Uniden Scanners. they may be looking for additional help in navigating the web for answers. An example of this is a newbie who asked me how to register their scanner(s) on a Uniden site and supply the required info the site needs to allow updates/upgrades. While the question may or may not have been totally inline with what Uniden intends to accomplish with this site, it was obvious he was becoming frustrated with the process. To be honest, it took some doing on my part as it's been a while, but I directed as best I could.

So, spending some time perusing the Forums and TWiki pages at RR is a good place to start. I also hold RR and their associated Forums and TWiki pages in a higher regard than newsgroups such as this one. That's not to say Yahoo user groups are donkey-do, just the opposite, they are really great! But the group's were created by product users, not manufacturer's representatives. Meaning there's none, or very little input by the manufacturers. (One exception I know of is Jerry Wanger of Connect Systems Inc., (CSI) a dealer in radios, who created a Yahoo user group in his name which is monitored by the company and frequently fields questions about their products... and I dare add they are not bashful about admitting they may not be the most knowledgeable party on a given subject, yielding to the group instead!)

Hope this helps,

Bill

Bill,

Yes it does. As I originally implied I wasn't sure where the advanced topics, problems and resolutions were discussed. The main reason I monitored this group is because my local county is set to change to P25 Phase 2 and was told there were problems scanning these systems.

Definitely know who the UPman is and I will pay more attention to the RR and TWiki in the future.

Thank you very much!

4857. RE: [BCD536HP] New file uploaded to BCD536HP

Yahoo group: BCD536HP
Date: 2017-06-18 19:33:42 UTC
From: Dewey
Topic: 602 Message: 4857

That is the link to the “Production” release firmware versions which hasn’t been updated since last year. The firmware updates being discussed in this thread (after 1.11.20) are beta release updates, which are now up to 1.11.31. If you want info on those releases, the Radio Reference page for those is https://forums.radioreference.com/uniden-tech-support/350343-bcdx36hp-false-tgid-display-investigation.html. Warning… if you haven’t been following it, it’s now up to 25 pages.

4858. Re: [BCD536HP] New file uploaded to BCD536HP

Yahoo group: BCD536HP
Date: 2017-06-18 20:11:38 UTC
From: Bill Nolan
Topic: 602 Message: 4858

Kevin,

I have two BCD536HP's and a BCD436HP that have no trouble with P25 Phase 2. I don't remember seeing much relating to complaints where Phase 2 and these scanners are concerned but a couple of years back I had listed a place in the files section where people could list the issues they experienced with (at the time) these new radios. Someone posted the text of the notes pertaining to this new firmware upgrade. It may have been me but if so, it was unintentional, accidental. I was going to post them to you on the group page but thought better of it as the link had already been posted-don't need duplications. I believe I also took down the file for listing concerns... it only had the description of this 1.11.31 version of the firmware update, so since it wasn't being used, I hope I blew it away. I also have read another post that seems to question the credibility of this new firmware update. At this point, concerning the credibility, I wish to not comment further. I don't know for sure one way or the other. I am not in any position to pass judgement. I would rather back away, ignore all I have seen posted, just as if nothing at all relating to a firmware update had been posted and wait for something official from Uniden.

That said, have fun researching the RR Forums and Wiki pages.

Bill

Bill,

Yes it does. As I originally implied I wasn't sure where the advanced topics, problems and resolutions were discussed. The main reason I monitored this group is because my local county is set to change to P25 Phase 2 and was told there were problems scanning these systems.
Definitely know who the UPman is and I will pay more attention to the RR and TWiki in the future.

Thank you very much!

From: Bill Nolan
Topic: 602 Message: 4859

Dewey,

Thanks for your post. I saves me some time and renews my confidence. I no longer question this ver 1.11.31 firmware upgrade and it not being listed as the latest update in the RR Wiki page because it's a beta. I am currently running Version 1.11.20. I believe it's the last (fully vetted? Is that the proper terminology?) firmware upgrade released.

Thanks again,

Bill

Although the audio quality of the 536 I thought was excellent and the best, yet, from a base/mobile scanner, I still use the Vertex MLS-100 external speaker which is the best (in my opinion) non-amplified speaker out there.

While not trying to turn this into a who's better rant, Uniden would make a good amount of people happier if they would just fix the patched talkgroup problem where their scanners will not receive all talkgroups participating in a patch, while the competition will.

So I jumped the gun. I have a trx-2 in my car, and like it. So I sold my 536 and bought a TRX-2. But there's absolutely no software like proscan for it. Log, capture, record, stream, etc. Pretty much a dealbreaker.

So my brand new trx-2 for your BCD536HP? Any takers? Great scanner otherwise.

4867. REPOST : No Reception

Yahoo group: BCD536HP
Date: 2017-06-24 01:55:13 UTC
From: Thomas Vance
Topic: 4867 Message: 4867

Please excuse me, I know I have posted this to a couple of the other groups other than the BCD996P2.

I cannot sign into the regular yahoo email page. It is all greyed out. I have checked for any and all Malware, Viruses and Rootkit's. None!!

I never seen my post come through to my BCD996P2 yahoo email account.

Please, I need some help with reception on my P2.

Several weeks ago I upgraded to the ProVoice so I could listen to

The City of Mobile Alabama system.

It has worked fine until day-before- yesterday. All of a sudden I stopped

receiving this system. So I went to Broadcastify , I knew that site would be working, but it to was

down and stated it would be up soon. So I thought to myself it isn't my radio.

So this morning I go to monitor the system and still no reception. So I go to Broadcastify to see if it is up or down and it is UP and

Broadcastify IS working.

Does anyone have any glues as what could be going on with my scanner or any

suggestions at all?

Thanks.

Thomas

Can you post to the group(s) you can't see? And you just are not seeing what it is you posted? Or anything else for that matter?

But you posted to this group successfully... I would compare your settings, setting up the errant groups like this one.

As for the 996P2 not receiving Mobile Al. County... From what I can gather, you have a radio that was performing nicely one day and not the next... RR shows no recent changes. Does the radio hear other comms? Is the issue only with Mobile? Eliminate some basic causes; Antenna connection? (You just experienced some severe weather involving lightning strikes-some disconnect their outside antenna and forget to re-connect.) External speaker-try disconnecting it. Did you possibly experience a lightning strike?

After trying all the "simple quick fixes", and the radio still does not work, reload the latest radio firmware and programming software (first save any programming lists you have custom created so you can reload them into the clean, new software).

But all I write is just "poking around in the dark"... hoping to "fall" into a corrective action.

Here's hoping yours is a simple issue, and if not, something that's covered under warranty,

Bill

4869. Bracket screws

Yahoo group: BCD536HP
Date: 2017-06-28 22:15:49 UTC
From: John Harris
Topic: 4869 Message: 4869

Does anyone know the size of the screws that hold the 536 in the mounting bracket?

4870. what made my favorites list so big?

Yahoo group: BCD536HP
Date: 2017-07-06 00:56:53 UTC
From: Evan Platt
Topic: 4870 Message: 4870

So I have most everything in one favorites list... I then wanted to do some DMR and P25 searching, so I exported local P25 and DMR frequencies from http://www.digitalfrequencysearch.com . I got a warning message to the effect of my Favorites list was over 1 MB. So I put the DMR and P25 frequencies I exported into a separate favorites list. Looking in the sentinel directory, my regular favorites list is 700kb, and my DMR / P25 list is 650kb.

So, I did some googling and most of what I see is "You should never hit the 1 MB limit."

So my regular favorites has much of the bay area california.

The DMR / P25 favorites is 3 departments (each a different county):

1508 channels
3097 channels
1195 channels

Isn't a favorites list text? Should that really be 700kb?

4871. What am I hearing on DMR?

Yahoo group: BCD536HP
Date: 2017-07-06 02:07:52 UTC
From: Evan Platt
Topic: 4871 Message: 4871

SO I put in a bunch of newly registered local P25 and DMR frequencies.

I'm seeing quite often the scanner stop on a DMR frequency - the display shows nothing (it actually says P25 search), but in Proscan, it shows a color code, no talkgroup ID, but alternating between TS 1 and TS2.

Is this encryption? I'm seeing 'traffic' stop for 20+ minutes. No 'audio' that I can tell, in general, but once I did hear what sounded like a person 'scratching' on the microphone, but normally no audio at all.

4872. Re: [BCD536HP] what made my favorites list so big?

Yahoo group: BCD536HP

From: MCH
Topic: 4870 Message: 4872

Remember that each channel contains a lot of info - including the
frequency, text tag, option flags, and other info.

Look at 700kB divided by 5800 channels. That's only 120 bytes of data
for each channel. Most of that is likely the text tag.

You did the right thing by splitting them.

What is causing it to be so big? Living near a major metro area.

Well it's odd - can't be data or encrypted - again, it a long continous carrier, and then audio. So for example, I have a 8 MB recording from Proscan - this one is 1 hour 8 minutes. Of dead air, aside from talking at the end.

I can put it on a FTP site, but not much to hear except for 20 seconds at the end.

451.9250 CC12 Apparently has a UID of 4019. Alternating between TS1/2

So - these were exported from digitalfrequencysearch.com as "Conventional". Could that be why the display isn't showing anything DMR related?

Program that channel as a trunked system.
That may be what they tell you, too.

Or at least AVOID it from the conventional scan.

Most likely you are getting interference on that frequency from somewhere else. Try using the color code and see if that takes care of it

Well I can't :-D I'm doing a search. Basically putting in newly registered DMR frequencies, and running a ID search on them. Don't think it's interference since it's just a 'stop' on the frequency - near as I can tell with volume up all the way no audio, so the other comments that it's a control channel seem to make sense...

What's the difference between a "MotoTRBO Trunk" system and a "DMR One Frequency" system type?

THey wouldn't be a trunk 'system', they would be a number of different frequencies, likely from different actual systems...

"MotoTRBO Trunk" is a multi-frequency trunk system.

"DMR One Frequency" is a single-frequency channel that has TGs.

Well sorry I should have been more clear - What is the difference in how the 536 handles it? What I'm getting at is basically am I going to have the same problem (ie the scanner 'locking' on a control channel) regardless if it's programmed in a One Frequency system or in a Trunk System system?

Either of those will not "lock onto" the control channel. They will look at it, evaluate it, then move on (unless there is a TG programmed you want to hear).

Does that answer your question?

Joe M.

Well so I'm doing ID Search, so I guess that's why it's locking on to the CC? So it sounds like it will do the same whether I'm in a One Frequency system or a TRBO system...?

There is no control channel on OFT, so the scanner won't lock up. OFT is sort of a programming trick to get the scanner to display more information than if you just programmed it as a conventional frequency.

That's all there is to it. Same thing as programming a conventional P25 channel as a trunk system. You'll see more data, such as UID that you wouldn't see if you just programmed it as a conventional P25 frequency.

If you have a lot of conventional frequencies, you're doing a Frequency Search, not an ID Search. To do an ID Search it must be programmed as a trunked system.

Ahh.. I guess what I'll be missing is alpha tags (or am I missing it)
that I can do on a "Conventional" system I can't on a TRBO system. :(

So on conventional, I can tag 453.125 as say "XYZ, Inc." which I can't
on a trbo system :(

I have it on many frequencies here too. It's interference.

Sent from my Verizon 4G LTE Droid
On Jul 6, 2017 19:29, "Evan Platt evan@espphotography.com [BCD536HP]"
<BCD536HP@yahoogroups.com> wrote:

Well I can't :-D I'm doing a search. Basically putting in newly registered DMR frequencies, and running a ID search on them. Don't think it's interference since it's just a 'stop' on the frequency - near as I can tell with volume up all the way no audio, so the other comments that it's a control channel seem to make sense...

On Thu, Jul 6, 2017 at 4:05 PM, johnstark@earthlink.net [BCD536HP]
<BCD536HP@yahoogroups.com> wrote:

Most likely you are getting interference on that frequency from somewhere else. Try using the color code and see if that takes care of it

<BCD536HP@yahoogroups.com> wrote:

Well it's odd - can't be data or encrypted - again, it a long continous carrier, and then audio. So for example, I have a 8 MB recording from Proscan - this one is 1 hour 8 minutes. Of dead air, aside from talking at the end.

I can put it on a FTP site, but not much to hear except for 20 seconds at the end.

451.9250 CC12 Apparently has a UID of 4019. Alternating between TS1/2

So - these were exported from digitalfrequencysearch.com
(http://digitalfrequencysearch.com) as "Conventional". Could that be why the display isn't showing anything DMR related?

On Wed, Jul 5, 2017 at 7:35 PM, MCH mch@nb.net [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

Could be data. Could be a control channel. Could be encrypted.
(although encrypted should show a TGID)

4893. New Firmware Released

Yahoo group: BCD536HP
Date: 2017-07-07 13:33:02 UTC
From: Uniden UPMan
Topic: 4893 Message: 4893

v1.11.31 Available now through Sentinel:

- Support hang time after voice termination in trunking DMR systems
- Support private voice grant message in Capacity Plus
- Added display of decode status during audio replay
- Improved the reception sensitivity of all digital systems
- Speed up scanning of DMR systems
- Support RAS detection in Tier 3 (including Capacity MAX) and DMR One Frequency systems
- Fixed the issue of P25 band plan
- Modified to not displaying "LNK" by receiving terminator in staying on P25 control channel
- Fixed the issue of displaying false DMR TGID
- Modified detection criteria of encryption in Capacity Plus
- Strengthen tracking of voice slots in DMR One Frequency systems
- Added recovery processing for the missing of avoided TGID in DMR One Frequency systems
- Modified judgement criteria for Hytera XPT

From: davidchast@...
Topic: 4893 Message: 4894

I just installed the update through Sentinel. It has only been a few minutes, but initially, at least, I'm pleased to report that the update seems to have resolved an issue I and others were having with P25 groups not being received by the scanner.

I'm in an area where the signal strength from the P25 Phase 2 group (Bucks County, PA) is quite strong. Prior to installing the update, signal strength would reduce to zero (no bars). After the update, 5 bars!

In the past, in order to receive that P25 Phase 2 group, I learned that I (sometimes, it was sort of random though it happened more and more frequently as of late) had to select the CHANNEL button to lock it on (hold) to a P25 talk group channel, then select the DEPT channel to hold the group. Selecting and deselecting the DEPT channel four to eight times while maintaining the hold on the channel usually resulted in the signal strength returning from 0 bars to 5 bars. Of course once the scanner was turned off (which it did each time the vehicle was started), resulted in the loss of reception (0 bars).

So, THIS IS A GREAT UPDATE! Now that the update is released and the release note indicates, "Fixed the issue of P25 band plan" I would be interested in learning more about the P25 band plan issue perhaps through release notes:
1) What was the actual issue (in layman's terms),
2) why did selecting and deselecting the hold on the DEPT key seem to resolve (temporarily) the problem,
3) was this update addressing the problem that is described above or is it just a coincidence that after the install it seems to be resolved and
4) why didn't the issue materialize until after the first year or two of use?
Thanks,
David

David,

I too ask myself the last question... it seems after a period of a couple of years issues arise. I can't be specific and I know my concern is as unscientific as it can get, but when I read your post the last question jumps off the page. It just hits with a lot of familiarity.

Maybe it's just a long learning curve that had people unsure if the radio works as advertised. And it takes two years for them to be confidant enough to post something. Putting into words, trying to describe something we are not familiar with, first needs to be identified as legitimate, and not just some expectation erroneously assumed by us. That could take some time also. The last thing anyone wants to see is a post that complains about something, with no basis for it.

But it still got my interest quickly enough. A feeling like I was thinking the same thing but Hadn't put in words yet.

Or is it in fact something Uniden is aware of and has chosen to remedy it before telling anyone? If true, that's posturing on Uniden's part but it's more a matter of making improvements as they go along instead of fixing known bugs regardless of whether they admit publicly to them or not. These radio are not the crystal controlled Bearcats and Regencys of days past. We've come a long way since my first Radio Shack Patrolman tunable 30-50 MHz receiver.

Bill

Not true. Reread my post again. I said nothing about sitting on anything for two years... by anyone or any company. Instead, I suggested there may be times when a deficiency was not made public while corrective action was being pursued. And that is NOT "sitting on an issue" as you put it. It's working the problem while protecting company interests.

Stop putting words in my mouth.

Unlikely, as that would require a hardware change.

Although the improved decoding might improve the audio on those systems.

Topic: 4893 Message: 4901

Can Paul or anyone who can do a CRC check verify if this release is the same as the 1.11.31 beta? I attempted to update the 536 which already has the 1.11.31 beta, and Sentinel refused to update, telling me I already had the latest version. I was going to force an update on the 436 by reinstalling 1.11.20, but for some reason, the 436 will not roll back to that version despite my placing it in the firmware directory and rebooting. Anyone who has a copy of the both the official 1.11.31 & the beta 1.11.31 who can do a CRC check for me?

I haven't done a CRC check, but Uniden's 1.11.31
is 1.11.31 whether it's beta or regular.

They simply released the latest beta version as a regular release.

The new firmware does seem to have helped sensitivity on the 436 & 536 as I am hearing some sites I hadn't received prior the update on Indiana SAFT statewide system P25.
Haven't noticed anything on DMR yet as they have been fairly quiet lately. Not sure what is up with that.

Unfortunately, no improvement in audio at all. My local P25 P2 system borders on unintelligible most of the time. Female dispatch voice has lots of harsh distortion, male voices muddy with too much bass.

All else works, but I have a very strong signal so it worked before ever since 1.11.31
If anything, my little BCD325P2 has more intelligible audio, so the 536 is just an expensive paperweight for my system.

If you have poor signal or interference, the improvement won't
be realized. In your case it sounds like interference. A strong
signal reading does not negate interference.

Try moving your antenna for a possible fix.

Hello, so before the latest update I could hear our local P 25 vhf trunked system. Did the update last night and it is now deaf. If I hook it to an outside antenna it starts receiving again . I saw a post earlier that mentioned adjusting the settings, thresholds etc. Where is that located, in radio or Sentinental? And are there any guidelines for these?

Thanks, Scott

also, was wondering if this can't be fixed, can I find the older version and reload that so I can at least hear the stuff I heard yesterday?

Intersting, because one of the reason I bought the 536 was that, in my opinion, it had the best audio I'd ever heard from its internal speaker of any scanner since the original Electra Bearcat crystal scanners.

Even so, I use the Vertex MLS-100 which is just about the best non-amplified external speaker I've heard so far.

Antenna is a coaxial dipole in the attic, plenty of signal strength. Tried the attenuator and also switching to my 225-400 LP. No improvement in audio quality. I do get periodic Close Call hits on a bogus FM station freq like 100.4 MHz. Two-tone intermod is a possibility. Nearby frequency band looks quiet using a SDR as a cheap spectrum analyzer. Voice quality on this system was not great when they were conventional, was really hoping the new P2 digital would clean them up.

This one works for my BCD536HP located in the middle of five P25 simulcast towers:

https://smile.amazon.com/gp/product/B00L3ZRF9A/ref=oh_aui_search_detailpage?ie=UTF8&psc=1
<https://smile.amazon.com/gp/product/B00L3ZRF9A/ref=oh_aui_search_detailpage?ie=UTF8&psc=1
>

I usually build my own antennas but was short on time. For the low price, this antenna works well but is still a bit touchy on setup for proper aiming. If you go with this antenna, you will need an N-male to BNC cable of the right length, or N-male to BNC adaptor and supply your own short cable to reach the radio.

With the latest firmware update and use of the Yagi antenna, I am now able to monitor our local PD & Fire talkgroups for the first time since they moved to the APCO P25 simulcast system quite some time ago. Fortunately, the audio is not encrypted.

HTH,

Tom King - KD5HM

Yeah, made the coaxial dipole myself. Current one is a copy of one I made a couple decades ago when I had access to network analyzers. Made one VHF and one UHF sleeve dipole that covers the entire 225-400 MHz band. Essentially PVC pipe, maybe 1 1/2 in stuff, wrapped with copper tape. Gap is fed from some RG58 coax coming up through the center. Need to keep the coax centered as the lower dipole 1/4 lambda section forms a choke. Have my original on the roof stuck on a vent pipe for disguise, just never got into the attic long enough to connect it.
Far as I know, no simulcat issues where i live, just lousy audio processing from Uniden. The 325 and 536 sounds acceptable over headphones other than too much bass. Running through speakers, female and male voices when emphasized sound over-driven and very harsh. That tells me the audio circuitry is not designed well. If I had the schematics, could look to see if there are significant differences.

If I was serious enough, might tap into the AGC and run it to an outboard audio section of my design. Having P25 P2 decode is great, but of what use if you cannot understand the voices? I live in a warm climate, so headphones are not comfortable for long.
Still, this is what we paid for?

4916. DMR

Wondering if anyone can shed some light on this:

A few years ago, my city (Hopatcong, NJ) went to DMR Single-Frequency. I use Sentinel and, via RR, have the Favorite List for my town included - looks fine. I don't have it locked out or stuff like that and have never heard anything while scanning.

I don't normally use the Close Call feature but, a few days ago, I turned it on for the hell of it (Close Clall - DND), and I am getting broadcasts from the police in my town. I know it's not another venue, because they reference street names in town.

Any clue what I'm doing wrong?

Regards,

Paul, N2PJW

Likely this is a programming issue.

Are you SURE they are using a one-freq system?

Are you SURE you have the appropriate Service Type enabled?

Are you SURE you have the range set to encompass the repeater location?

Are you SURE the color code is correct? (and the slot settings)

Those are the main points I can think of offhand.

It's a single frequency DMR system but RR says "Hopatcong
PD operations are protected by RAS. You will not be able to scan by talkgroup."

RAS supposedly stands for "Restricted Access to System"... whether in part or whole I have no clue but since you hear intelligent comms, I suspect it's no encrypted, just made difficult to follow by talkgroup. RR data shows only the PD is DMR. Fire is Conventional on a county system.

4920. Mobile UPS?

Yahoo group: BCD536HP
Date: 2017-07-19 00:21:16 UTC
From: davidchast@...
Topic: 4920 Message: 4920

I primarily use the 536 in the vehicle. Each and every time the vehicle is started the 536 self-powers down. I read that it does this as a protection for the unit because it detects a drop in voltage. Unfortunately, I loose all of the temporary avoids and it sometimes wipes out my P25 Phase 2 reception, though it has been somewhat better since the firmware upgrade :) .

My question is this: Is anyone aware of a product that can draw a charge from the vehicle's 12 volt electrical system, store the electricity, aka through a smaller battery, and continuously pass it through to the 536, while also maintaining the needed voltage for the 536 when the car is started up?

In my mind I was thinking about something like the power bricks used to keep cell phones going. The power brick plugs into the car's electrical system via USB port and then the brick powers the 536. Of course the problem is the amperage that the power brick puts out. Those products are low amperage. I don't know what the 536 needs but I suspect this set up would not work. Any ideas?

David

I don't think you are doing anything wrong. What I learned just by viewing RR data, it appears to be single channel on VHF High Band. Only one frequency assigned... Its that RAS (restricted access system) that seems to be messing it up for you.

Wondering what luck you would have by including only what data is provided in the close call mode, where you can actually hear the comms? If you can do this, and set it up in a favorites list you should be golden. Only two talkgroups... should be easy enough to separate in your mind after you become familiar with the unit numbers and types of calls one handles as opposed to the other.

I, too, use my 536 in my car. I have heard the same thing that the unit, if left on, will “power down” and reboot itself if you start the car while the scanner is still turned on. I don’t believe this causes any harm to the unit, but yes, it WILL reset all of your “temporary” avoided. That is what happens ANY time you turn it off and back on, you’ll lose the temporaries.

I have heard that there is a way to avoid this problem, as you stated there is something you can rig up that will maintain the voltage to the scanner so that the “drop” is not detected. I’m no electrical engineer but I’m sure someone here can give you the correct information.

2 batteries + battery isolater to charge second battery. Works well. Or just by a small sealed battery charge it when needed

How is it wired? The 536 shouldn't know or care if the engine is started, what it sounds like is happening is the battery is dropping a good amount in voltage when you start the car. I had my 536 wired direct to the battery and it never did that. Is it an older battery?

I now have two batteries - second battery in the trunk, with an isolater and a charge guard. The charge gard keeps things going to the second battery running for time specified after I shut off the engine. The isolator prevents the second battery from draining the first battery. The second battery charges when the car is running. I used to have a 536 in the car, but now have a whistler trx-2 (I needed a remote mount scanner).

I initially tried that (wiring directly to the battery) but without isolation, the voltage drop can still cause the scanner to reboot. Instead, I resigned myself to setting up the power requirements with a relay that cuts power to my battery power bus when I turn off the engine. (The voltage drops below a certain level at that point and triggers the isolation circuitry to power off. It automatically restores power when the engine is started up again, increasing the voltage.) The fact that the scanner doesn't have a chance to write to memory (on the mini SD Card) when you leave the radio on and let the relay switch do the on/off thing is only a problem if changes are made to your program. You must remember to manually turn the scanner (BCD536HP) off using the scanner's on/off switch. This is the prescribed method which first allows the scanner to write to memory that which you changed before it then powers down. Since I don't temporarily avoid, I have no problem with this setup. But if I did, the second battery with isolation would ensure the voltage level remained at a certain level, keeping the scanner powered. It's good you can get it done with just the one battery however. But not all setups can maintain the voltage level as yours does.

As noted the amperage draw from the starter motor will drop the voltage below the threshold needed to run the radio. Even a good battery can momentarily drop the system to 10.6vDC and still start the car. The specs indicate the radio requires 11.0vDC to operate. Silly 1/2 volt. As the battery ages it will drop below 10.6vDC when starting and if other stuff is trying to run while starting the car the voltage will be still lower.

Higher capacity battery will prevent the voltage drop. I also suspect a capacitor to either start the car or maintain radio voltage for that period will cure this. I've seen capacitors start car engines with no battery in the car.. Use your Google skills and you'll find several promising capacitor solutions. These are commonly used in RV rooftop air conditioners to give their compressors a bit more voltage on startup. (Maybe all air conditioners?) Ain't rocket science. :-)

I had the same problem with my 536 wired directly to my battery in my 2012 BMW. The battery voltage dropped below 10V on startup and rebooted the scanner. It was a real problem because my car has auto-start-stop of the engine at traffic lights, etc. I considered a variety of options like a UPS setup, but the cost and complexity drove me to a different solution. I just purchased a DC to DC converter off ebay that takes an input of 8-16v with a constant output of 13v. It did the trick and the scanner stays on when the car starts. I had to get a housing for the converter, but it was not a difficult install.

I posted some photos of my setup in the Photos section (look for scan800), however I chose to put in a remote power control, so the setup looks rather complicated. The power converter is fairly simple by itself.

It's been a long time , but I had a 2nd 100Ah battery in my truck. I put a 100A diode inline with the positive from the car battery before it reached that 2nd battery. It allowed current to charge the 2nd battery--and prevented current from the 2nd battery from returning to the main battery OR powering anything before the inline diode. In the back country a backup full-size battery is peace of mind.

I would imagine a 10A rectifier diode + 4.5Ah SLA battery would work fine. The small battery always charges quickly and doesn't drain the larger. There may be a forward bias voltage drop of .5V or so. Not an issue.

I don't know the input power spec on the 536, but if 5V compatible... the good USB battery packs have a regulated 2.1A or so amps at 5V. The bad, cheapy ones are unregulated 5V.

Get small 12 Volt gel cell, connect in parallel, FUSED of course at less than 5 amps, with vehicle battery. In the positive lead, put a Schottky diode between the vehicle and new aux battery, cathode to the aux battery. Wire scanner to aux battery. Start car, aux battery floats scanner and will power it for several hours with no problems.

Bill

A DC - DC step up converter will do what you want. I had the same problem and a friend designed one that works well. You can buy the modules on Ebay or Amazon for not too much money. You'll need to add a case, wiring, maybe a resister or two to set the input and output limits.

It's a simple project and works well for this. I've had mine for close to a year with now problems.

You need 13 volts DC (nominal) output for a 536. I think the fuse for the power is 2 amps, but it might even be less.

Mine is set for an input as low as 11.0 volts and consistently puts out 13.8 volts.

4939. Whistler vs Uniden / Wish List

Yahoo group: BCD536HP
Date: 2017-07-26 04:23:30 UTC
From: Evan Platt
Topic: 4939 Message: 4939

So I put a TRX-2 in the car. No choice, as I needed a remote mount unit. I would have gladly gone with the 536 if it did remote mount.

One thing I like about the trx-2 is scanlists are 'linked' to the channels. Maybe someone has a suggestion on how to 'mimic' what I have on the trx?

Basically what I have on my Uniden (and TRX-2) is a number of systems where a system may include channels that are duplicated in many systems.

Examples:
Local Fire
(Has local fire talkgroups)
Local PD
(has local PD talkgroups)
Local PD & Fire
(has all PD & FD talkgroups)
Tri City PD
(Has contents of Local PD plus a few other PD's)

etc.

Now on the TRX, the scan lists points back to the channel. So if I change the Alpha tag of say 2113 "Police Secondary" to "Police Car-Car", it changes among all scan lists that use that channel. I know there's scan lists and all but is there an 'easy' way to tag them? So on the TRX, I hit Menu, Scan, and I can name and select the scan lists to scan. That's easier than remembering that 1 is Local Fire, 2 is Local PD, etc? Is there something like this on Unidens?

Thanks :)

I use a different scheme that is map-based, and the keypad corresponds to the map with the first digit of the FL Quick Key being a wider map coordinate and the second digit a more refined area within that wider region. when I scan, I scan based on the area I'm in and a few primary systems. I don't scan based on services. If I did that I would never be able to follow anything because the scanner would always be talking with channels from various areas.

If I want to hear a service in that area, I use the DEPT button to hold that Department (be it PD, Fire, EMS, Schools, or any of another 40 departments I have in each System).

If I wanted to separate things strictly by service, I would scan everything and use the Service Types to select which ones to hear.

4943. Siren app

Yahoo group: BCD536HP
Date: 2017-08-03 07:53:34 UTC
From: hennieedelenbos@...
Topic: 3654 Message: 4943

HI all,

When listening to my scanner via the Siren app the last second of a conversation is cut-off. When a new conversation starts, whether it is 2 seconds or 3 minutes later, I hear the last second from the previous converation first. Is ther a way to tune this?

Another question: Will NXDN be available. I would to hear TETRA also.

Regards,
Hennie.

As I've mentioned before, I don't see Uniden ignoring NXDN, as there are so many users switching to that mode. As for TETRA, there is only one system in the US that I know of, and it may or may not be on the air, so I would not hold my breath for that mode.

(remember, Uniden America is only concerned with North America)

On the play issue, try resetting the scanner (card) or reformat it or replace it. It sounds like a pointer is not set correctly.

I believe that is addressed in the manual.

As well as can you save all your ID hits and such to a .csv file as well like their other Pro software.

I haven't found the need to use that feature of the radio or save ID hits to .csv extensions. Possibly someone else in this group can field that one?

And what is the drawbacks on the 536 Pro software? Someone had told me that the Pro did not have features you can use on the 536 like you have been able to do with their Pro software on prior software versions for other

The "drawbacks" question is vague... Unless you have a question regarding a SPECIFIC feature found on previous models, which is NOT on the BCD536HP, it is impossible to say. Just because these previous features (if in fact they exist) on older model scanners are not offered on the BCD536HP, it isn't necessarily a drawback. They may not be of any consequence-not needed. If there IS a specific feature no longer being offered on the BCD536HP, and you would like to see it added, post it here. I am sure the group will be happy to offer reasons as to why it is no longer included.

But does it happen locally too? (using the local speaker)

4958. Attic Antenna For BCD536HP

Yahoo group: BCD536HP
Date: 2017-08-06 15:42:10 UTC
From: BCD HP1
Topic: 4958 Message: 4958

Does anyone have a suggestion for what is the best all-around antenna to use for the BCD536HP.

I have to place it in my attic and it is tight quarters. Our HOA doesn't allow us to put an antenna outside.

Also could you please tell me what connections the antenna needs as well as the scanner, where did you buy it from and do you have the Item or Part number?

Thanks In Advance,

Tom Tom

Joe M,

It is close. It is basically a crawl space. No higher than 4 ft.

Thank You,

Tom Tom / Ray Ray

Along these lines, I'd appreciate knowing what antenna everyone thinks is the best for outdoor reception for a BCD536HP, too, if you don't mind, please? A range of 30 miles or better possibly.

Thank you,
Tim

Typically, the HOA has no authority over what you put behind your unit/house as long as it isn't visible from the front or common area. So putting an antenna in your space is allowed if the attic isn't viable (some loss through the roof, it depends on the type of roof too). Simply mounting a small one on the window trim may be enough, but it won't be one of size. Using small wire makes it invisible too, from even a few feet away.

The antenna size/type partly depends on what you want to hear (which band, what distance) and the construction of your unit/home (stucco being one of the worst to block RF).

The (outside) antenna can also be made stealth, it depends on your level on inventiveness and building ability. Fastening a fine wire up the grooves in siding for example, painting to match, using a fence or deck, some appear to be roof vents, loads of options. Using a pre-amp at the outside/attic antenna may provide enough boost to help too.

It's this very reason that I no longer live in an HOA infested area or one with CC&Rs.

At 4' you might be able to fit a VHF Quarter wave.

I would consider an outdoor antenna such as the Ventenna which looks
like a vent pipe. IOW, hide/disguise what they don't want to see.

<<http://www.ventenna.com/>>

I don't know how well they work, but you will have to have a compromised
antenna anyway.

4965. Re: [BCD536HP] Attic Antenna For BCD536HP

Yahoo group: BCD536HP
Date: 2017-08-07 19:20:05 UTC
From: Rick WA6NHC
Topic: 4958 Message: 4965

At 4' of space, if you need VHF low (30-70 MHz) you'd have to coil or bed the vertical section, detuning it slightly. For high band and above, it would be enough for a discone. Your roof WILL attenuate the signal, some more than others. There is no way to compensate for that loss on weak signals.

The Ventenna is unity gain and from what I've heard, works, but not very well.

A #18 wire ground plane would work as well (stapled to the wall) and be invisible beyond 20' (paint the coax). You could make multiple vertical dipoles (one per band) of #18 for a multiband (some interaction but acceptable), staple them to the outside wall (towards the general direction of interest or a corner for more directions) and only the coax would show (small hole from the attic to outside? Run it down the side of a trim piece, no one will notice). No gain in strength, but it might not be needed (add a pre-amp at the antenna/s, inside the attic feed point if coming through the outside wall).

4966. Re: [BCD536HP] Attic Antenna For BCD536HP

Yahoo group: BCD536HP
Date: 2017-08-07 18:51:07 UTC
From: Rick WA6NHC
Topic: 4958 Message: 4966

Again, what band(s)? If only one direction is needed (you're at the top of a canyon or one end of a valley), beam antenna(s) would be the best, pointed to the transmitter(s) of interest (highest gain, nulling out other stations not in that direction). With the move to the higher frequencies, these can be physically small, an advantage to you; easier to hide or incorporate into 'modern art'.

If you need to receive from multiple directions and bands, a simple discone style antenna is likely the best. While it provides almost no gain, it's very broadband (covers a wide range). If you only need one band and multiple directions, a high gain vertical antenna for that band is appropriate; often they are dual (or tri) band (a 5/8 at 150 MHz is also resonant at 54 MHz.). Look at ham antennas (Diamond, Hustler, others) online for some ideas depending on your needs.

The 30 miles may not entirely be dependent on your antenna, some licenses require no coverage beyond a certain point (wishful thinking) to avoid interference with other nearby agencies using the same frequencies. (With the right combination of antenna and pre-amp, I was able to reliably hear one UHF system 90 miles beyond what that license allows, it wasn't cheap.)

If you want good advice, you have to provide good information and the limitations of your location.

And I'll mention that small satellite antennas are Federally exempt (in the US) from any HOA limitation AND that they can be made into 'slot' antennas for specific bands (high band and up), so it could be stealthy, in plain sight. The only complaint you'd likely get is if you had more than one or two... nothing they can do about that.

One issue with scanning in general, is that if you get too much signal, it can be as bad as too little (more in the digital realm). But with a range of 30 miles+ that won't likely be a problem.

I have several outdoor scanner antennas for 2 groups of scanners at my desk, but I bought this indoor antenna that I mounted to the inside trim of my office window specifically for a Whistler TRX-1 when I am in the office and want to hook it up without having to disconnect or switch antennas at the desk. A police office friend recommended it and it is just fantastic. Hooked up to my TRX-1 it pulls in signal as good as the wideband discone and the directional yagi I have on a mast 18ft high outside the radio room. I not only recommend this for folks such as yourself that are somewhat limited in their options, but also for anyone who needs an extra strong antenna for a handheld scanner while indoors, in an RV, campsite, up in an attic, in a window, etc. Great antenna!!
And - it's only $25. You can't go wrong with this antenna.

Thank You Joe M. & Rick.

I appreciate it so much.

I ordered my 536 yesterday and I am like a kid waiting on Santa but 65 years old.

I am sure I will be asking the group for help. I have cut my teeth from the very 1st BearCat scanner were it was 1 crystal install

All the way up to this bcd996P2. I understand that the 536 is a different breed on it’s on.

Thanks Guy’s,

Tom Tom / Ray Ray

You're quite welcome!

While you're waiting, grab (download) a copy of Sentinel and play with it (download the weekly database update after installing Sentinel).

Then start building your lists, profile, service types etc. So when it arrives, you're on top of some of the programming. Zap your list(s) in, you're off and running.

Then study the manual (NOT before bed). You need it, this isn't an old crystal Regency scanner.

I'll venture that the stock antenna will be enough, or move it near a window.

>
> The Ventenna is unity gain and from what I've heard, works, but not very well.
>
> A #18 wire ground plane would work as well (stapled to the wall) and be invisible beyond 20' (paint the coax). You could make multiple vertical dipoles (one per band) of #18 for a multiband (some interaction but acceptable), staple them to the outside wall (towards the general direction of interest or a corner for more directions) and only the coax would show (small hole from the attic to outside? Run it down the side of a trim piece, no one will notice). No gain in strength, but it might not be needed (add a pre-amp at the antenna/s, inside the attic feed point if coming through the outside wall).

Regarding; HG Police Scanner Antenna ($25)

Radio Reference Forums reviews has not one good review of this antenna, at best, equating its performance to the stock telescoping antenna that comes with any base scanner, followed by "Don't waste your money!" So, either those that like it haven't bothered to review it (a likely scenario-we feel compelled to complain when we feel short changed and post reviews to that effect-but not so much when we are satisfied), or it's just so much junk.

Keep in mind that most residences are wrapped in moisture barriers, some having a metal foil backing to tends to have the effect of a "Faraday Cage" which degrades the ability to "hear" RF signals indoors.

My take on ANY attempt to gain better reception (other than using the stock indoor antennas) is this... first and foremost, direct all your attention to using something you can get away with on the OUTSIDE of the building. Failing that, it's a crap shoot. A mobile antenna in the attic crawl space would be my next thought.

Additionally, outside antennas come with additional concerns for grounding. And throwing on a ground strap attached to a 4 foot grounding rod only draws more attention to your "clandestine" antenna installation. Even if there are NO covenants or restrictions, building code dictates the inclusion of Lightning protection. God forbid the building fire was caused by lightning and your antenna played a part in it.

However, if you are a ham who lives in a dwelling with these outside antenna restrictions, there may be some help around the corner. There is currently a US Senate Bill (that has already been unanimously passed in the US House) which will allow for the consideration of outside antennas. It is called the Parity Act. If passed, no longer will the property owner or home owner's association be able to say no just because they can. If you are not a ham, take the entry level test (no Morse Code requirement) and get your ticket. Once the law passes (hopefully), you would then be able to approach the "NO police" with a reasonable expectation they consider your proposals. It's not a guarantee but it will have the effect of forcing the associations to give valid reason instead of just saying no. And if an impasse occurs, the courts are now there to intercede and rule on the matter. We may still loose but it's better than what we now have.

Regarding the HG indoor scanner antenna, I didn't mean to ruffle feathers, just voicing my opinion. It works well for me as a standby for the TRX-1 if I want better reception than a rubber ducky. To each his own, what works for me might not work for you. If I listened to all the negativity and bad comments I would never have bought the BCD536HP or the TRX-1 for that matter. I ignored the negative rants and bought them both and I am very glad that I did. I am not always swayed by public opinion. I agree with the poster who said that most consumers post a negative review only if they feel cheated in some way. I think most people have to be overjoyed and very happy about a purchase in order to be moved to write a good review, An unexpected surprise, customer service that is beyond the cubicle, that sort of thing. Unfortunately, that is not the norm these days. Bad reviews are also used by competitors to undermine each other. You can't always believe what you read, just sayin.

I didn't mean to promote a product that is not favorably reviewed on RR, I was only hoping to provide a suggestion that was economically feasible and possibly an alternate solution to the OPs dilemma. I apologize if I offended anyone.

I didn't mean to give you the impression your take on that particular antenna was wrong. On the contrary, it pleased me to see that someone has had a favorable experience with it. I only wished to provide further input so others could have a more informed basis when considering their alternatives. It also allowed for my expressing personal observations, my experience with indoor antenna systems, which boil down to mostly, a trade-off, signal strength for ease of installation and cost. I realize the case in point has to do with outside mounting restrictions, but before indoor antennas are considered, all possible outside options (sneaky or otherwise) should be studied first.

Please don't think you should need to apologize for your much appreciated offering to the group, or me in particular.

4973. Fvaorite Lists on Siren App

Yahoo group: BCD536HP
Date: 2017-08-09 18:13:04 UTC
From: n2mwe@...
Topic: 4973 Message: 4973

Anyone else with the Siren App on iPhone notice you can't turn all favorite lists on or off? Basically, you can only control lists 1 through 9. If you attempt to turn on 19, you will turn off 1. Is anyone even TRYING ti fix this app som it works properly? I would love nothing more than to put my 536 back in the car and control it with my iPhone or iPad.

You can control 0-9, ten lists. Do you really need more than that or could your programming be more creative? I keep 5 local faves broken into service type and location...

Local FD
Local LE
All of interest, next county/state/country (I'm in N ID) over (X3)... then when I travel, I open it to the full database so it self programs and it's simpler.

4977. Questions about Sentinel & ARC Pro %36 Software

Yahoo group: BCD536HP
Date: 2017-08-11 14:56:54 UTC
From: BCD HP1
Topic: 4977 Message: 4977

Hello,

I see in the Sentinel software that the EDACS for my area is programmed into the scanner.

But when I use ARC 536Pro to read from scanner, everything downloads except the EDACS systems.

Could someone please explain to me why this is or is happening ?

I am new, just got the scanner yesterday and I am learning.

Thanks,

Tom Tom /Ray Ray

Well, on the bright side, it's bound to play better than the stock antenna... and you've now joined the world of aftermarket antenna collectors! I can't remember how many I bought (and built-home brew) before my wife and I bought our own house, living in apartments. (And then afterwards... at the closing on the house they shoved a list of covenants and restrictions under our nose-one forbid outside antennas of any kind. The developer originally intended on creating a homeowners association! We were the first to close in our new development and the assoc idea was still being toyed with... but after others also objected they dropped the idea-it took years though. One of the ideas was to take a long extension cord you plug into a wall outlet (two wires) and cut a length out of one side of it, then measure a 1/4 wave length where both wires continue to run parallel and cut the other side (that's NOT connected to the wall plug). The idea was to get a passive resonance from 1/2 the entire wiring of the house! Dumb idea! But I saw it somewhere and tried it. Needless to say the best I could hope for was something akin to a "long wire antenna". It played the same wether it was plugged in or not! I instead ran a long wire of the proper length looped in my attic.

4980. BCD536HP Quick Key Question

Yahoo group: BCD536HP
Date: 2017-08-13 05:06:15 UTC
From: BCD HP1
Topic: 4980 Message: 4980

Hello,

Still new, Just got mine 2 days ago.

Okay, I have 4 separate EDACS towers. Salco Rd, Saraland, Wilmer and Mobile Simulcast .

We will call then 1 through 4 which corresponds to the front face plate buttons 1 - 0

In all my other Uniden scanners in order to lock out one of those towers all I had to do was tap the Number, example 3 and it would lock it out tower(Wilmer) and not receive it.

I am not talking about SYSTEM quick keys because there is so little to monitor that I want to hear. I only use QUICK keys.

How do I accomplish this on the BCD536HP. I have notice I cannot just tap the #3 button. That doesn't work on this scanner.

As always, any help is greatly appreciated!!!

Ray Ray

One way you could do that is make 4 separate Favorite Lists (FL).

4983. UID's Not Showing or Logging

Yahoo group: BCD536HP
Date: 2017-08-14 21:49:43 UTC
From: BCD HP1
Topic: 4983 Message: 4983

Hello group!

Back with another question please?

I go to Menu, Scroll Down To Display Options,

Tap Yes, Scroll Down To Disp. Unit ID, Tap Yes,

On Disp. Unit UID I go to On and Tap Yes.

And the systems are Motorola (EDACS). & ProVoice

I am sitting here with a BCD996XT and a BCD996P2 and seeing the UID's show up on those 2 scanners.

The UID does not show up on either new scanner I just received 5 days ago, not does it show up when logging with Butel 536 Pro.

Is there something I am missing or could I have gotten 2 brand new bad Units?

Than You,

Ray Ray

Yes Joe M.

They are programmed as a trunked system. (Or supposed to be!!)
Here is a short story behind this. I ordered 2 new 536's last Monday and
they arrived Thursday.
I let the place where I purchased them from program the for me and went
ahead and did the DMR & ProVoice because The City of Mobile, Al is using
ProVoice.
I have a 996XT and a P2 sitting right here with them and they both show the
UID's while looking at the 2 - 536's they show nothing.
I do not know anything about this Sentinel software at all. I am use to use
another Pro edition for all my scanners for many years.
In the Sentinel software it shows the EDACS is programed in , but when I
move (Export the HPD file) and load it into the
Other software it shows everything just like the Sentinel has in it except
there is no EDACS in it.

Thanks,

Ray

No idea about the export/import difference.

On the UID, check the display mode (FUNC-9 while not holding on a channel). You might have 3-line mode enabled.

From: BCD HP1
Topic: 4983 Message: 4987

Joe M.

I do not know if this will make sense to you or not.....
Per your instructions, I checked to see if 3 lines was enabled. Yes it was.
I changed that to off.
When I changed it from 3 lines to off the Talk Group ID's stopped showing
and stopped logging in the ARC Butel Grid..
When I changed it back to 3 line the Talk Group ID's started logging again.

I still cannot get the UID's / Unit Identification Number's to log though.

Thank You,

Ray

They stopped showing? What was showing on the display?

But it has to be OFF for the UID to show.

4989. 536HP Question

Yahoo group: BCD536HP
Date: 2017-08-16 20:24:01 UTC
From: Nicholas Rondeau
Topic: 4989 Message: 4989

Question:
I am programming a couple of 536HPs and own a 436HP. I have been using the Sentinal Software. I have favorites lists 0 to 12 and 99 setup (with frequencies). 99 is set to not be active upon startup.
Question is when I or others turn off the favorites list say I keep 1, 4, 10, 12 and turn off 0, 2, 3, 5, 6, 7, 8, 9, 11 and 99 but when the scanner is turned off and turned back on it doesn't keep the same configuration it goes back to the settings from the computer software. Previous scanner BCT15x would remember the favorites lists that were turned off each time the scanner is turned off and then turned on.

It should remember it. When you shut it off are you using the on/off
switch? If so what does it say on power-down?

4991. Re: 536HP Question

Yahoo group: BCD536HP
Date: 2017-08-17 10:22:55 UTC
From: N1chu
Topic: 4989 Message: 4991

I hesitate to mention, as it is most probably NOT what is causing your problem, but thought it worth mentioning, just to eliminate one possible cause...

How are you turning off your radio? Are you using the on/off volume control knob on the radio? Or are you divorcing the radio from power? (As if you pulled the power cord off the back of the radio, leaving the on/off volume control knob in the "on" position). My installation (vehicle) is powered directly from the battery. I also installed a CHARGEGUARD (made by Havis model CG-X), an automatic on/off switch that senses when the ignition key is turned off (killing the engine) and will divorce power to my radio. (It also turns the power back on to the radio when I start the engine.) I no longer need to manually turn off the radio. I leave it on all the time and let the CHARGEGUARD device turn my radio on and off. Otherwise, I would eventually kill my battery, as the radio would continue to discharge the battery over time-my vehicle will sit for days at a time without being run.

But, it is NOT the prescribed method of turning off the scanner because any programming changes made while operating the scanner will not be saved. The scanner's normal shut off procedure (using the on/off volume control knob) allows for the scanner to FIRST write to memory, any changes made BEFORE powering down. this means if I want to save any changes (such as my turning off one of my FL's), I must use the scanner's normal shut off procedure (the knob), letting the radio write my new settings to memory. Then turn it back on... before turning off my ignition switch.

But like I have mentioned, I state all this out of a preponderance of caution... to eliminate this one possible cause.

Moving forward, (under the assumption NONE of what I write is the cause), where the radio is being turned on and off as prescribed by Uniden (again, using the knob), I suspect the radio is not writing changes to its memory. And since that memory is stored on the micro SD Card, I question the SD Card's reliability? Or something's amiss with how the changes get written to the card?

4992. Re: [BCD536HP] 536HP Question

Yahoo group: BCD536HP

From: Mark Lassman
Topic: 4989 Message: 4992

Yes, both radios, the 536 and 436, should remember the settings that it had at the last power-down. I’m pretty sure there is a menu setting, however, to set it to do that.

4993. RE: [BCD536HP] Attic Antenna For BCD536HP

Yahoo group: BCD536HP
Date: 2017-08-12 18:44:14 UTC
From: BCD HP1
Topic: 4958 Message: 4993

N1chu,

Myself and a friend ordered at the same time from a company well know.

2 of the NCD536HP's. This past Monday on the 7th and had THEM to set them up and do the ProVoice and DMR upgrades as well.

They arrived Thursday morning and I already had an outside discone antenna and hooked mine up and is doing great!

EXCEPT this all new to me. I have always used ARC BUTEL programming Pro software and I am confused on this Sentinel software.

I wish I knew how to save the file in the scanner it over to the ARC 536 Pro software, but I do not even know where to begin.

Getting back to the H.O.A. , My friend had already bought a pole, Mtg hardware, cement and also a discone and coax.

He got his son to help because like me he is elderly , and they (" Someone from the H.O.A.) must have been watching

because after he had gotten the antenna in the ground and mounted to the outside of his home, they came up to him and told

him it had to come down. He argued with them and said he was leaving it up. I will not mention the City here in South Alabama,

but they called the Police out. The officer was shown where he was not allowed to have an outside antenna and he made my friends

son take it back down. (To me this would be a Civil matter) I do not see were the Police has any jurisdiction unless he had a court order.

He is planning on going to court about this. What good it will do him I do not know.!!!

Well, on the bright side, it's bound to play better than the stock antenna... and you've now joined the world of aftermarket antenna collectors! I can't remember how many I bought (and built-home brew) before my wife and I bought our own house, living in apartments. (And then afterwards... at the closing on the house they shoved a list of covenants and

restrictions under our nose-one forbid outside antennas of any kind. The developer originally intended on creating a homeowners association! We were the first to close in our new development and the assoc idea was still being toyed with... but after others also objected they dropped the idea-it took years though. One of the ideas was to take a long extension cord you plug into a wall outlet (two wires) and cut a length out of one side of it, then measure a 1/4 wave length where both wires continue to run parallel and cut the other side (that's NOT connected to the wall plug). The idea was to get a passive resonance from 1/2 the entire wiring of the house! Dumb idea! But I saw it somewhere and tried it. Needless to say the best I could hope for was something akin to a "long wire antenna". It played the same wether it was plugged in or not! I instead ran a long wire of the proper length looped in my attic.

Subject: Re: [BCD536HP] Attic Antenna For BCD536HP

Regarding; HG Police Scanner Antenna ($25)

Radio Reference Forums reviews has not one good review of this antenna, at best, equating its performance to the stock telescoping antenna that comes with any base scanner, followed by "Don't waste your money!" So, either those that like it haven't bothered to review it (a likely scenario-we feel compelled to complain when we feel short changed and post reviews to that effect-but not so much when we are satisfied), or it's just so much junk.

Keep in mind that most residences are wrapped in moisture barriers, some having a metal foil backing to tends to have the effect of a "Faraday Cage" which degrades the ability to "hear" RF signals indoors.

My take on ANY attempt to gain better reception (other than using the stock indoor antennas) is this... first and foremost, direct all your attention to using something you can get away with on the OUTSIDE of the building. Failing that, it's a crap shoot. A mobile antenna in the attic crawl space would be my next thought.

Additionally, outside antennas come with additional concerns for grounding. And throwing on a ground strap attached to a 4 foot grounding rod only draws more attention to your "clandestine" antenna installation Even if there are NO covenants or restrictions, building code dictates the inclusion of Lightning protection. God forbid the building fire was caused by lightning and your antenna played a part in it.

However, if you are a ham who lives in a dwelling with these outside antenna restrictions, there may be some help around the corner. There is currently a US Senate Bill (that has

already been unanimously passed in the US House) which will allow for the consideration of outside antennas. It is called the Parity Act If passed, no longer will the property owner or home owner's association be able to say no just because they can. If you are not a ham, take the entry level test (no Morse Code requirement) and get your ticket. Once the law passes (hopefully), you would then be able to approach the "NO police" with a reasonable expectation they consider your proposals. It's not a guarantee but it will have the effect of forcing the associations to give valid reason instead of just saying no. And if an impasse occurs, the courts are now there to intercede and rule on the matter. We may still loose but it's better than what we now have.

Having gone through this myself...

The procedure is that they have to go to the HOA board and ask for a variance. The police have ZERO ability to do anything about it, it is a civil matter, not criminal (it wasn't a legal order from the police).

If the board denies the variance, there is a procedure for appeal, then its off to the courts. First they must READ the rules and CC&Rs to understand what and where things can be done. In my case, as long as it wasn't in the front of the property or in the common area, I could do whatever I wanted, UNTIL it was visible from the front (no tower). My HOA only got upset after they found I had a wire over the tops of the trees in the common area, that had been there over 6 years with no one noticing it (variance denied).

I wish them luck, HOA are a virus and need to disappear; the sour old witch that ran the board has nothing left in her life to other than make life hell for anyone that crossed her. My answer was to sell, in fact I left the state because finding a place without an HOA, in a place that I'd actually LIKE to live, was impossible. *NEVER *again.

I now have over 12 acres, the closest neighbor is 700' away, on a hill and no one has the right to tell me how or where to do anything. No permits required either. My tower goes up next year and the view is even better than what I had before. I win, screw HOAs.

Ray Ray,

As far as the Butel and Sentinel software is concerned, there is plenty of help available. But in regards to your specific question regarding loading files, both programs will accept any file already installed in the scanner. For example, the first thing I did when I got my BCD536HP was to download and save whatever was shipped on board the scanner into the Sentinel software. I could have also done the same with the Butel ARC program. I run both and haven't figured out either one! I believe both are lacking. But I don't intend on further researching my lack of understanding as I have what I need for Favorite Lists (FL's) and the scanner is programmed correctly. (I haven't even firmed up any questions I would need to ask! I'm waiting for someone else to do the heavy lifting on this one and hopefully, later, program updates will negate my concerns.)

Thanks for relating your antenna restriction story. I also believe the police would not be the enforcement agency assigned the task of ensuring the antenna was taken down. Unless the association has already sued and won a judgement on the matter. In which case in my state I believe a sheriff would have served papers to the offending party. Those papers would stipulate the antenna should be removed by a certain date under threat of a citation issuance/court appearance. (At least I think that's how it works in my state.)

Something to consider, study the entire list of restrictions and canvas the neighborhood for violations. Hopefully, you will find some. If you find enough, leverage that against the antenna restriction. But be careful, drawing attention to others that have violations won't make you very popular. But if you learn they gained wavers, ask how and pursue that line before getting the courts involved. Good luck with all of that.

God forbid the building fire was caused by lightning and your antenna played a part in it.

However, if you are a ham who lives in a dwelling with these outside antenna restrictions, there may be some help around the corner. There is currently a US Senate Bill (that has already been unanimously passed in the US House) which will allow for the consideration of outside antennas. It is called the Parity Act If passed, no longer will the property owner or home owner's association be able to say no just because they can. If you are not a ham, take the entry level test (no Morse Code requirement) and get your ticket. Once the law passes (hopefully), you would then be able to approach the "NO police" with a reasonable expectation they consider your proposals. It's not a guarantee but it will have the effect of forcing the associations to give valid reason instead of just saying no. And if an impasse occurs, the courts are now there to intercede and rule on the matter. We may still loose but it's better than what we now have.

5000. SC Card Reder and SD Card

Yahoo group: BCD536HP
Date: 2017-08-19 19:10:13 UTC
From: BCD HP1
Topic: 5000 Message: 5000

Could someone suggest a 2.0 USB Card reader and Card for this 536hp.

The closest place to me is a WalMart store. There are no other electronic stores within 25 mile of me.

And I am disabled and hard to get to other places.

I can order on-line stuff though!

Thank You.

Ray

Joe M.

I apologize that I haven't gotten back to you before now. Emergency in family.

The 3 lines show,
The Tower I have programmed in,
Description of System it hits on,
And the Channel Tag Name.

Ray

No idea about the export/import difference.

On the UID, check the display mode (FUNC-9 while not holding on a channel).
You might have 3-line mode enabled.

Thanks JD.

Would you happen to have the Item number or a link to the one you purchased?

It would be a great help. I could be looking right at it, but I still do not know what to get.

Thank You!!

From: BCD HP1
Topic: 4983 Message: 5005

Joe M,

Not sure what you mean by 3-line mode.
This is everything it shows on the front display on the front of the scanner.

F0:-------------11:44 <<<< I think that is time. I have watched it and it appears to be Military time.

SO:------------# of the Twr I have programmed in. 1, 2 , 3 4 Which ever tower it is on a that moment

Tower I have programmed in

Description of System it hits on

And the Channel Tag Name

I have just about every scanner that Uniden Bearcat has made going back to the 1 crystal days up to the P25, but this is by far the most advanced scanner I have used.

In settings the display mode for UID was off , I turned it on and when I did it quite showing the TIGD's had no effect on the UID's.
So I turned it back on and it started logging the TGIDS again. Still NO UID's.

I will admit I am lost, very lost on this scanner.
I have read the manual what little I can make out with poor eyesight and the same for Mark's Easier to read Manual.

Ray

5006. Re: [BCD536HP] UID's Not Showing or Logging

Yahoo group: BCD536HP
Date: 2017-08-21 00:08:05 UTC
From: MCH
Topic: 4983 Message: 5006

3-line mode is the function I described previously and is controlled
using FUNC-9 while not scanning. The non-3-line mode is the other
setting that shows the UID at the bottom.

What you are describing is 3-line mode. Disable that and I bet you see
the UID.

5007. RE: [BCD536HP] UID's Not Showing or Logging

Yahoo group: BCD536HP
Date: 2017-08-21 10:52:24 UTC
From: BCD HP1
Topic: 4983 Message: 5007

Joe M.

I cut the 3 line to off and I watched the scanner, it does show the UID #
but when it logs it may log1 out of every 20 or so even if that many.
I am watching my P2 scanner and it is logging every UID that comes up.
Is there something wrong with these 2 new BCD536P or is there another
setting somewhere?

Thanks a million,

Ray

No need for the apology.

What does the non-3-line mode show?

Joe M.

From: BCD HP1
Topic: 4983 Message: 5008

Joe M,

Also on both the 536's and the P2 they are both set for 2sec hold time.

If I do not answer you in a couple of days, this windows 10 preview insider is fixing to crash and I have to reinstall everything.

Ray

5009. Re: [BCD536HP] UID's Not Showing or Logging

Yahoo group: BCD536HP
Date: 2017-08-21 12:30:33 UTC
From: MCH
Topic: 4983 Message: 5009

OK, so half the issue is resolved (showing). I don't believe I can help with the logging aspect. If it is working on 1 out of 20, it cannot be a setting unless there is a duplicate system with different settings (and even then I can't think of a setting that would prevent logging).

What we don't really know is whether the issue is that the 536 is not outputting the data or whether the SW is not seeing it correctly. I don't know how to test that short of trying a different logging SW.

I would contact the supplier of the logging SW unless there is someone on the list who may be able to shed some light on that part.

5010. Re: [BCD536HP] UID's Not Showing or Logging

Yahoo group: BCD536HP
Date: 2017-08-21 12:33:23 UTC
From: MCH
Topic: 4983 Message: 5010

There is a program called RH-536 (or something like that) that may show
the output data on a PC. If it shows the UID info correctly 100%, that
eliminates the 536 as the cause.

5011. Re: [BCD536HP] UID's Not Showing or Logging

Yahoo group: BCD536HP
Date: 2017-08-21 15:38:07 UTC
From: Paul Haskins
Topic: 4983 Message: 5011

Was not following this - what are you using to log with?

I've found Procomm is near 100% as is the record function on the 536 (and HP1 as well). I have also used a 325 sent to Pro96comm as well.
In short - no issues for me with a 536 - I have around 300 UID in my database ID'd as well.

To: BCD536HP@yahoogroups.com
Sent: Monday, August 21, 2017 8:30 AM
Subject: Re: [BCD536HP] UID's Not Showing or Logging

OK, so half the issue is resolved (showing). I don't believe I can help
with the logging aspect. If it is working on 1 out of 20, it cannot be a
setting unless there is a duplicate system with different settings (and
even then I can't think of a setting that would prevent logging).

What we don't really know is whether the issue is that the 536 is not
outputting the data or whether the SW is not seeing it correctly. I
don't know how to test that short of trying a different logging SW.

I would contact the supplier of the logging SW unless there is someone
on the list who may be able to shed some light on that part.

5012. How do I enter a ham radio frequency in this complicated scanner?

Yahoo group: BCD536HP
Date: 2017-08-21 18:07:56 UTC
From: mcfarlane_bob@...
Topic: 5012 Message: 5012

I have hit a new level of frustration with this scanner and the manual. I'm new to this scanner and digital scanning in general. But all I want to do is enter a few ham radio frequencies and store them. But the manual is not written for guys like me and I can't figure out how to do it. It's a breeze on my old analog Realistic Pro-34 scanner but it's a nightmare on this radio. Can anyone explain how to do this in "dummies" terms?

5013. Sentinel Software

Yahoo group: BCD536HP
Date: 2017-08-21 18:00:18 UTC
From: Ray Ray
Topic: 5013 Message: 5013

Hello Group!
My windows 10 crashed and I am trying to reinstall everything.I try installing my Sentinel software but it will not let me.Keeps say cannot reach this page.
Does anyone know how to tell me to install l.NETFRAMEWORK.I went to optionalfeatures using the run command unchecked the 4.7 and checked the 3.5 and clicked okay, but it will still not install or download the file.
Thanks
Ray

Topic: 5012 Message: 5014

You really didn't specify, but to just monitor that frequency directly, while not scanning (holding on a channel) hit the frequency followed by the CHANNEL button.

To enter it in a FL/System/Department, do the same but hit the ENTER button in place of the CHANNEL button and follow the prompts.

Sentinel uses Dot Net Framework 2.0. It's included with Win 10. Never never uninstall 4.7 unless you want to break another program using 4.7. The Dot Net Framework versions are designed to co-exist.

I don't know what link you are using to download but try this one

5018. How do I enter a frequency and save it somewhere on this scanner

Yahoo group: BCD536HP
Date: 2017-08-21 13:42:54 UTC
From: mcfarlane_bob@...
Topic: 5018 Message: 5018

I hate this scanner with a passion. Actually, I think I hate the instructions more than the scanner. All I want to do is enter a single conventional ham radio frequency and save it somewhere but I can't figure out how to do it. I'm used to conventional analog scanners and this thing has me about ready to throw it off a bridge.

Joe M,

You and I have talked many times through the group and off the group.
The SW Maker is you know who, and he said I didn't know what I was doing.
I have bought his Pro software as far back as I can remember.

He has always been unfriendly.
I use to even test his beta's for him before they were released to the
public.
My computer did crash and I just got through reinstalling everything.

The only thing that will not install is The Sentinel Software. Because of
the .Netframework. I have tried everything to get the .Netframework to
install.

Have a great day, and again Thank You

Ray / Known as Thomas in the other Group

5023. RE: [BCD536HP] Sentinel Software

Yahoo group: BCD536HP
Date: 2017-08-22 18:57:48 UTC
From: Ray
Topic: 5013 Message: 5023

Joe M.

Firewall is not blocking it. There is even no anti-virus installed and Sentinel was the 1st piece of software I tried to install after

A clean re-install of Windows 10 Pro.

Ray

From: Ray
Topic: 5013 Message: 5024

Bob,

Thanks for your input.

I know already what you are saying,

But it will not install the ,Netframeworm.

You can even go to (type this into your run) optionalfeatures, put a check into the 1st box like you are supposed to do and uncheck the 2nd box. Then hit ok.

It will run like it is going to install then it pops up with a message to check windows updates.

Then it comes up with the message “Windows Cannot Install This Update”

Thanks,

Ray

Subject: [BCD536HP] Re: Sentinel Software

Sentinel uses Dot Net Framework 2.0. It's included with Win 10. Never never uninstall 4.7 unless you want to break another program using 4.7. The Dot Net Framework versions are designed to co-exist.

I don't know what link you are using to download but try this one

http://info.uniden.com/twiki/bin/view/UnidenMan4/BCD536HPFirmwareUpdate

I'm sure your ISP has a firewall installed.

I've seen this before, and the direct .NET install solved it.

Cannot go back to a restore point. I tried that through the trouble shooting, all I could do was a complete new re-install

Of the operating system.

From: Ray
Topic: 4983 Message: 5027

Joe M,

Did that to and it will not install.
Says something like I have a later version already installed.
If there is one, I cannot find it. I even downloaded UltraSearch
And went into view tab and under options to show hidden files and protected
hidden system files.

Ray

5028. Re: [BCD536HP] UID's Not Showing or Logging

Yahoo group: BCD536HP
Date: 2017-08-22 19:33:20 UTC
From: MCH
Topic: 4983 Message: 5028

Make sure you're talking .NET 2 and no other version.
.NET is not cumulative among the major versions,
so .NET 3/4 does not replace .NET 2.

If it still objects, remove .NET 2 and reinstall.

Joe M.

From: Ray
Topic: 4983 Message: 5029

Joe here is what I downloaded NetFx20SP2_x86 . You can no longer get just .net 2

Here is a .jpg of what it says when you go to install.

I also read were Microsoft is doing away with. Netframework altogether.

Ray

Joe M.

No Firewall Blocking it and No Anti-Virus. I have it shut off and went and made sure Windows defender was off!

Here is an error message:

Windows Installer installed the product. Product Name: BCDx36HP Sentinel. Product Version: 1.07.05. Product Language: 1033. Manufacturer: Uniden. Installation success or error status: 1603.

But it would not install.

Ray

You cannot shut off a firewall on your ISP's equipment.

Others have had the issue where their ISP was blocking the DL.

5035. RE: [BCD536HP] How do I enter a frequency and save it somewhere on this scanner

Yahoo group: BCD536HP
Date: 2017-08-22 22:35:01 UTC
From: Rich
Topic: 5018 Message: 5035

use either the Sentinel software (free) or one of the commercially available packages (I use ARC536 from Butel). if all you truly want to do is listen to a single ham frequency then you bought the wrong scanner. plenty of good used analog scanners with direct keyboard entry on Craig's list and eBay. this ham freq you want to hear…is it analog or digital?

'73,
rich, n9dko
As you get older your secrets are safe with your friends because they can't remember them either.

I hate this scanner with a passion. Actually, I think I hate the instructions more than the scanner. All I want to do is enter a single conventional ham radio frequency and save it somewhere but I can't figure out how to do it. I'm used to conventional analog scanners and this thing has me about ready to throw it off a bridge.

5036. Sentinel Software

Yahoo group: BCD536HP

From: Ray
Topic: 2510 Message: 5036

Paul.

I watched your videos on how to install the software. Great, thank you!!

Yes I did go to that link you provided and re-downloaded it, thinking maybe I got a bad DL.

I tried the below as well.

I downloaded and executed it but it still says the same.

https://www.microsoft.com/en-us/download/details.aspx?id=6523

It says the following:

Windows Features

An app on your PC needs the following feature:

.NET Framework 3.5 (includes .Net 2.0 and 3.0)

Download and install this feature

Windows will get the files it needs from Windows Update and complete the installation.

It starts off say downloading files.

The it says:

Windows features

The following feature could not be installed

.NET Framework 3.5 (includes .Net 2.0 and 3.0)

Windows could not find required files to complete the requested changes. Make sure you're connected to internet,

And try again.

Error code: 0x800F081F

Tell me how to solve this problem The link to that is :

https://support.microsoft.com/en-us/help/10164/fix-windows-update-errors

I did everything step by step. Still nothing!!

5044. Connecting Uniden BCD536HP to WiFi

Yahoo group: BCD536HP
Date: 2017-08-23 08:54:43 UTC
From: webcamvoyuer@...
Topic: 5044 Message: 5044

I'm trying to connect my scanner to my home WiFi so that I may use the app and listen to the scanner via a mobile device remotely.

WHen I plug in the WiFi Doggle nothing happens/changes on the scanner screen?
What should I be doing?

5045. Re: Sentinel Software

See if this link helps:
https://www.symantec.com/connect/articles/understanding-error-1603-fatal-error-during-installation

I did a google search on the error code 1603.

5046. Re: [BCD536HP] Sentinel Software

```
Well, if Windows doesn't see it as installed, that explains
why Sentinel doesn't see it as installed and fails.

That is the issue that needs solved.

Joe M.
```

Joe M,

NO!!!! No .NET

Ray

From: BCD536HP@yahoogroups.com [mailto:BCD536HP@yahoogroups.com]
Sent: Tuesday, August 22, 2017 11:56 PM
To: BCD536HP@yahoogroups.com
Subject: RE: [BCD536HP] Sentinel Software

Joe M.

Under Program and Files there is no .Net to uninstall.

Ray

OK!!! :-)

But why are you replying to your own post, Ray?

No .NET = No Sentinel.

Just as no SD card = No scanner operation.

Joe M.

5049. RE: [BCD536HP] Sentinel Software

Yahoo group: BCD536HP
Date: 2017-08-23 17:26:21 UTC
From: Ray
Topic: 2510 Message: 5049

Joe M.

To be honest with you, I am very sick and have had emergencies in the family.

I think what I am going to do is just get away from the scanner & sentinel software until I get better.

I am not thinking and focused like I should be and normally am.

Again, Thanks to each of you that has helped me. I do appreciate it very, very much!!!

Ray

From: Ray
Topic: 2510 Message: 5050

John,

Thank You.

I read over the complete page and I did change 1 of the DWORD’s to 0 but that did not help.

I just give up.

I thank all of you that have helped me. I just miss having the database. I check it daily.

I can always go to RR and find if anything in my area has changed, but it is very nice to have the whole country at your fingertips.

Ray

In reply to you “The other Ray”

I have been scanning since I was 16 years old. I am now 65, Just turned it on the 23rd.

In response to your comment to take up golf, I wish I could just walk ½ of a block.

I have on 1/8 of a Heart. The rest of my heart is completely dead. Just the front side of the lower right lobe.

To Joe M. and the rest that tried to help me to get this .Net Framework to install,

I appreciate it more than you will ever know.

I have now gotten it installed.

For future reference if anyone has this problem, make sure that windows is not trying to download or install any updates.

That was my problem. It was downloading updates for Microsoft Office and also for the new 16273 Insider Preview Edition of windows.

Again Thank you ALL!

Ray

From: Bob McFarlane
Topic: 5018 Message: 5054

Thanks for the info. Actually, I want to enter a lot of frequencies (analog and digital) but I have to start somewhere. I figured if I could just get the process down for entering one frequency it would be applicable to any other frequecies I want to enter and my confusion would be solved. I will try the software route as you suggest.

  To monitor a single frequency ANY SW is overkill too.

Just do as I said before.

From: Bob Peloquin
Topic: 5018 Message: 5055

In Sentinel (the free software that comes with the HP series) you must create a "system", "Department", and then the "Channels" for each group of frequencies you wish to add that are not already in the database.

One way to get started is to copy a specific system from the main database into a brand new favorites list you create. Then use the "star with pencil" icon to edit that favorites list, adding frequencies to existing systems/departments and deleting or "avoiding" those you don't want.

When you're satisfied, you save the favorites list and upload it to the scanner. Then, on the scanner, select the favorites list and de-select the main database. This will speed-up the loading upon powerup.

Some hints and tips:

You MUST assign a "Service Type" to each frequency you add. The default is "Custom 1" and it won't scan your new frequencies unless you either change them to the appropriate Service Type (Law Dispatch, Law Talk, Multi-Talk etc.) or enable the Custom 1 Service Type

You SHOULD assign a latitude, longitude and range circle to each new department and/or system. Without this, they will not be scanned at all if Location Control is enabled for the favorites list you've added. The scanner always wants to use your location and the system's location to determine whether or not a particular channel will be scanned. If you do nothing, it WON'T be scanned. You need to specify a location or turn off Location Control.

You MUST manually update and frequencies in your favorites list if something should change. While the RadioReference.com database is used to update the Uniden copy, and thus your scanner's main database, it will NOT update your personal favorites list's frequencies if something should change. You have to do this yourself as necessary (not frequent).

You MUST have a computer running Microsoft Windows to run Sentinel. It can be on a Mac but you must also run Windows using a multi-operating-system software like Parallels etc. to install Windows and run Sentinel.

You MUST have reliable, low-latency high-speed Internet to update the database using Sentinel. You could do it from a local library, McDonalds etc. with a laptop and WiFi but dial-up or satellite Internet won't work.

5057. Scan Mode, Nothing to Scan

Yahoo group: BCD536HP
Date: 2017-09-04 17:12:21 UTC
From: Bill Nolan
Topic: 5057 Message: 5057

It's been a couple of years since I created my FL's or used the Sentinel software. (Occasionally I would update the database but that's about it.) So, when I decided to do some file housecleaning, and updating in my FL's I opened up Sentinel and created a couple of new FL's and deleted a bunch of others. I then wiped the memory in the scanner, removing ALL of my FL's and tried to load my new ones. I got only as far as Sentinel telling me the upload was done. But when I rebooted the scanner I get Scan Mode, Nothing to Scan.

If I recall correctly, this has been discussed here before. And I seem to remember it was something simple overlooked that was causing it. I can't remember what that is however, and I'm stuck with a scanner that although the software says has loaded correctly, shows no FL's.

What am I missing?

Bill

Make sure you have:

1 - Set those FLs to download.

2 - Set those FLs to Monitor (ON).

3 - Enabled any Quick Keys you have programmed.

4 - Enabled any applicable Service types.

Joe M.

Possibly enabling your service types. Example - if Law Dispatch is not enabled in Services then no dispatch frequencies/TGs will scan. That was the problem for me when I got the dreaded Nothing To Scan message. Hope this resolves it for you

Yep, got it working. I didn't go into the profile and set the parameters. One thing has me still stuck. I now see all of my FL's Loaded into the radio with Sentinel. But I am also using ARC Butel software. I am missing one FL when I try and read the radio using the ARC software. It appears in the radio but NOT in ARC...

5062. Re: [BCD536HP] Scan Mode, Nothing to Scan

Yahoo group: BCD536HP
Date: 2017-09-06 10:49:58 UTC
From: N1chu
Topic: 5057 Message: 5062

Thanks Paul, That wasn't it... But it WAS one of the first things I checked because, as you say, it would also cause the "Nothing to Scan" message. I posted on 3 groups and got a reply that instructed me to make sure I checked in Sentinel to see what my "Edit Profile" settings were set to. There are options to "Monitor" and "Download" that needed to be set to "On", and another box that needed to have a check mark in it. That fixed my problem... almost... one of my FL's was still not showing when I left Sentinel and opened the ARC Butel software, so I reconstructed it.

I liked the Butel software for all previous Uniden scanners I've owned but their Pro version for the BCDx36HP seems buggy to me. I attribute this to Butel's notation that it is NOT a replacement for Sentinel, instead an editor (with other pluses that Sentinel does not have). I'm hoping Butel will fine tune the product as they have done with their other releases-time will tell.

Admittedly, having not used either program routinely since I first set up the scanner a couple of years ago, I am guilty of negligence. Instead of re-reading the software manuals, I took the easy way out and posted on the groups.

In my defense, since I am traveling to Virginia Beach, Va. for the Airshow at Naval Air Station Oceana this coming weekend, and didn't finalize my plans until late, I wanted to re-program my scanner quickly. When I ran into problems, I panicked. I was running out of time! Thanks to all for pulling my fat out of the fire! Now, if there was something you could do about Hurricane Irma... it just may be chasing me back up the east coast to Ct. on my way home Monday.

(The Blue Angels Navy Demo Team attend the show every year. The performers and myself stay at the Hilton Oceanside, a 14 story(?) hotel with an outside pool deck on the top of the building. Their show pattern includes numerous flybys at the same level as the pool deck... so close you could almost reach out and touch them! It's a heck of a lot closer to the F-18's in flight than anything you see at show central, the airport at NAS Oceana! With my 536, li-ion motorcycle battery and an amplified speaker, I set up shop, tune into the "Blue's" comms and meet people, usually scoring a few beers for my trouble!)

Thanks to all for the help.

Bill

It looks like info for that area was just updated on 8/15. Have you updated the database in your scanner? If not, Install Sentinel, plug the scanner in, let it be recognized, run Sentinel, then select UPDATE in the menu, then UPDATE MASTER HPDB, and finally write to the scanner (SCANNER, then WRITE TO SCANNER).

5069. Department Quick Keys

Yahoo group: BCD536HP
Date: 2017-09-12 08:12:39 UTC
From: Paul Axsom
Topic: 5069 Message: 5069

So, I’ve finally learned how to program and access Favorite Quick Keys, and System Quick Keys. I see Set Department Quick Key within the menu, but nowhere within the manual on how to toggle Departments on and off through the use of Quick Keys.
Could someone give just a little further guidance in this matter please?

5071. Display full DMR Data on ID search?

Yahoo group: BCD536HP
Date: 2017-09-13 18:35:47 UTC
From: Evan Platt
Topic: 5071 Message: 5071

So I haven't done this in a while so can't recall if it's operating the way it was before.. I have a number of frequencies in a system - dmr 1 channel, all freqs in the same system on ID search.

When the 536 stops on a frequency, it just shows "TGID 32". I seem to recall a more ... informational display - TS, CC, tx id, etc? Does that only display if I'm in frequency search?

5072. When does a 536 croak?

From: SmokChsr
Topic: 5072 Message: 5072

We'll have to see if Paul is allowed to tell us how they were able to get the 536 to sense the seriousness of it's need and fail accordingly.

Yep Irma is raging, and the 536 is a critical part of the com plan.. and you guessed it "SD card read failure".

Yes I'll fix it when I get a chance to slow down but in the mean time it meant re allocating several assets to cover for the 536.

PS Ya just got to love it when it seems electronics know when you're really counting on them. :)

That's when you replace it with your hot backup card
that you programmed long before the emergency started.

Bingo - back up. Isn't Murphy part of your plan?

5074. 546 vs 996P2

Yahoo group: BCD536HP
Date: 2017-09-14 06:54:06 UTC
From: neil.neilbell@...
Topic: 5074 Message: 5074

Debating whether or not to replace my trusty 996P2. I use the scanner in my home only, attached to a good discone mounted about 20 feet high. I have a couple of questions related to my listening area (The SF bay area). I listen to a large P25 trunked system called EBRCS, Also listen to CHP highway patrol, a 40+ mHz conventional system.

For CHP I have set up three systems, Golden Gate, Sacramento and Stockton. Each of these has a unique system quick key. For Golden Gate I set up about 8 "groups" for the major "beat areas" each with a GQK. The EBRCS system if broken up into Fire, PD, Sheriff, Medical and several others, each set up with a System Quick Key. So my question, especially for those familiar with bay area scanning, is - - -starting from scratch how should I set these up with FL, Systems, Depts etc.?

Help and suggestions appreciated!!

Neil Bell, KJ6FBA

SmokChsr, Sorry to hear your SD Card failed at a most inopportune time. And, of course, you didn't have an already pre-programmed replacement sitting on the shelf ready to go!

Redundancy is part of the game plan these days. I have two BCD536HP's (mobile & base) and a BCD436HP. In my case, while it can be expensively prohibitive, (buying more than one of the same scanner), I opted to because of the complex nature of our scanners. A failed SD Card is only one of many issues that may cause the scanner to go down. And during crucial times such as a hurricane, there's no time to troubleshoot. Having covered Joe M.'s reference to Murphy's Law with 3 "like" scanners allows for that redundancy. And if I only owned one "SD Card" scanner, I'd be following his advice with a spare SD Card. At least I could protect against (I dare say) the most common failure that is associated with this scanner in times of need.

One man's opinion,

Bill

You could simply make one Favorites List then set that up the same as
your current configuration. Then use FLQK.SQK ENTER to replace your
existing scheme.

Or you could set each System up on a separate Favorites List if you want
to retain the current key scheme. FLQK ENTER

Departments would be set up in either case the same as your existing scheme.

One of the biggest tools of a mission critical system is redundancy. Always have a hot spare or work-around for any part of the system that can fail. If a consumer grade scanner is part of the mission critical portion of your system have a spare or at least (as Joe suggested) a spare SD card, as that is the weakest point of the scanner.

Just as a follow-up, a good place for a spare card on a 436 is inside
the battery cover. On the 536, taped to the rear or side is good. On the
536 there is enough room to put the card in a case and tape that.

And don't forget up write any new data to the backup as well as the
primary card!

5079. Re: [BCD536HP] When does a 536 croak?

Yahoo group: BCD536HP
Date: 2017-09-14 16:13:11 UTC
From: Gary Saffer
Topic: 5072 Message: 5079

I keep a spare card in my truck for my mobile 536HP. It's programmed identically with the one that is in use. It's easy to do it using Sentinel or even ARC536.

Consumer grade scanners are often used in emergency response, but the key is to make sure that there is redundancy. (As others have noted)

I think that if I needed a consumer grade scanner for emergency response, I'd be more inclined to use a BCD996P2. It has fewer features, but it's a bit more robust in that it doesn't use a SD card. I think that's what is in the latest ambulances my former agency purchased. Given how averse the radio shop guys are to scanners in general (along with anything that doesn't have a batwing logo), I'd want something that didn't need much attention after the initial programming. Unless, of course, you had a scanner geek that reprogrammed scanners for his unit and others on request. Not that I'd know anything about that. ;)

Sorry for the thread drift.

5082. Best Outdoor Antenna Setup/Config??

Yahoo group: BCD536HP
Date: 2017-09-14 20:43:22 UTC
From: Tim Ferguson
Topic: 5082 Message: 5082

Hi Everyone,

Looking for suggestions for the best outdoor antenna to use with a BCD536HP with the following in mind:

--- Have 40 ft tower to mount to
--- Monitoring analog VHF-High frequencies only, no digital, but need capability just in case.
--- Illinois State Police are digital, otherwise haven't heard that any of the local law enforcement, fire, or EMS departments are moving that way other than Washington County.
--- Would love to have 30+ mile range for Southern Illinois.
--- Live in the country where there aren't necessarily any restrictions (except an airport about 1 mile away as the crow flies).

Thanks,
Tim

VHF-High only? A Ringo Ranger will be the best bang for the buck.
(not original Ringo and not Ringo Ranger II)

Range will be determined by factors most of which make your receiving
antenna moot.

This antenna also works well on other scanner bands.

If your budget allows for the better part of 4-digits, I would have
other recommendations. But the above is still the BFTB winner.

You will also need a stand-off, but the RR is only about 12" in diameter
at the base (for the ring) so you won't need a large one.

Next logical question answer: RG-8X is good if you're going to be around
50' or less. Again there are better feedlines, but they are much more
expensive. If you are ever interested in getting your ham license, stock
with 50 ohm coax like the 8X mentioned. If you don't ever see that as a
possibility, RG6 is a less expensive alternative that may work a little
better for receiving, but will not work for transmitting.

Using a Diamond D-130J here on a two=story raised ranch mounted on an 8' mast on a roof tripod. Love it!!!? Two years in service now without a hitch and, with good cabling/ prudent connection insulation, have never had to climb up there since.

Paul

Well I had a 996P2 as the back up. Since it MY money I just can't afford to have multiple spare's of everything. In this case the spares were being placed into service for non typical special needs.

Considering the Very high number of failures of the SD card for these two Scanners as compared to every single other device that is using SD cards, there is a design flaw / poor engineering involved.

I know that can't be admitted officially, but I'm sure Uniden is aware and will change the design accordingly on the next release of the X36 line.

You ask for the "Best Antenna Setup/Config" using a 40 ft tower on only one band?

Simple,
Get yourself a good mono-band directional VHF High band antenna for the HF-High band and a rotator. Then feed it with the best feedline available. One such is the Belden 9913. It's what they commonly refer to as "poor man's hardline" because of its low loss on long runs and higher frequencies. You don't especially need this more expensive feedline at VHF-High frequencies but at UHF frequencies or very long runs on VHF-High band you will notice a difference... a good feedline is important. I don't think you mentioned how long a run you have. You may think you aren't going to bother with other bands but it's always nice to string a good quality coax that minimizes line loss once instead of having to run better coax later.

Bill

SD cards are pretty cheap - especially in the size needed for the x36.
I'm not sure what type of organization you're involved with that relies
on personal money for mission-critical components, but perhaps it's time
to look to one who will take the job more seriously and give you the
equipment you need.

As for the failures, what other devices rely so heavily on the SD cards
for read/write operation? How would you change the design in order to
keep the features but reduce the wear on the card? It's fairly simple -
you use it or you don't use it. When you use it, you put wear on it. If
you don't use it, you lose features.

Maybe sell your 536 and purchase another 996P2 if the 996P2 serves your
needs. They are less expensive and don't use cards. Of course, there are
"missing" features with that change, too.

Again, this comes down to this: If $3 is too much of a burden, or is a
cost that cannot be justified, your mission is not that critical.

I would break the favorite lists into much of what you've mentioned.

CHP GG
CHP Sac
CHP Stk (Each can be set to partial zones; you don't have to hear
Amador if you only want Sac etc).

Then break EBRCS into disciplines much the same way; FD/LE/?? and if you
need further definition, break that into local zones (only enter the TG
you want to hear for each FL, make sure the service types are set
correctly).

OAK FD
OAK PD
CC SO
Walnut Cr PD... whatever your choices/needs are. You'll end up with
small but focused FL, a LOT of them.

If that's too refined, then at least break it down as LE/FD/Tow/Utility
or whatever you choose to hear; one discipline per FL ONLY.

Then assign a FL quick key to each favorite list. That allows you to
add/delete on the fly, depending on your location or need; without
having to hear what you're not wanting.

It's more complex to set up, but to make most things simple (operating
the radio), it takes a bit more effort to get there. You may want a
cheat sheet to recall the quick keys though...

The list is long, Cameras, Cell phones, Tablets, etc. All those devices extensively use the SD card. Just gleaning the traffic on this list, and by the statement "you should keep a spare card taped to your scanner" the failure rate is extreme in the x36 Scanners as compared to any other device. From just what I've seen here and other places I would estimate the fail at above 30% and climbing.

As for the design change, the first step is fault analysis. From what I've seen and I'll look at mine when I get to it. In many cases if not most it's not a failure of the card, but bad data being written to it rendering it unusable. If the card is failing, it's more likely to be due to poor operating conditions provided by the scanner than a card defect or excessive R/W cycles.

At that point it's up to Uniden to correct the hardware and or firmware to prevent the problem.

While the memory cells in a SD card do have a finite R/W cycle life expectancy, they should not even be coming close to that in a scanner in this short of a period of time.

Also the card can't be read, that means bad data in the boot sector's. those sectors should be pretty much static. Therefore should have at least 20 more years of MTBF left.

We all know the x36 scanners were rushed to market, with that being the case I would suspect that R&D did not get a chance to spend as much time with the scanner as they would have liked.

More than likely Uniden is well in progress on the next version of the x36, and when it arrives hopefully most of these problems will be corrected.

Some good advice/suggestions for this user. For me, however, I had about 50 FLs, and have been able to pare them down to about 30, by combing some and eliminating others. I think I have it where I want it. I still have no idea how to set up the Quick Keys and such so that I can turn off and on the FLs as I wish. I've been doing it manually from the keypad each time and it gets to be a bear.

Not sure how to "enter the TG you want to hear". I know there are TG IDs, but can you, instead, use the "avoid" feature on the TGs you don't want?

Is there a "Quick Keys for Dummies" step-by-step instruction on how to set them up? I did download "Mark's Easier-to-read" manual but did not find it that much easier to read than the Uniden one.

Your reply indicates that you took my criticism of your "employer"
personally. Are you are a self-employed public safety provider?

Whether true or not, the provider should give you the tools you need
regardless of cost and without requiring use of personal funds.

Still, if a few bucks is enough of a financial strain to cause hardship,
well, I'm sure there are a lot higher expenses.

Joe M.

Assigning a FLQK is a matter of setting it in the menu (or SW).

Use is a matter of pressing the QK (1- or 2-digit) and hit ENTER.

Only if recording constantly. In normal use, those devices rarely write to the card (rarely compared with constant use). I would call none of them "extensive use". Of course, professional photographers will use them much more than the average user, but professionals also use much larger cards.

Compare normal use of those with a device that writes when it is receiving a transmission. Of course this will vary depending on how much you are scanning, the activity level of the channels, etc.

> While the memory cells in a SD card do have a finite R/W cycle life
> expectancy, they should not even be coming close to that in a scanner in
> this short of a period of time.

And that is the issue. It can be reduced by disabling the REPLAY function which will greatly reduce the writes to the card. In fact, it would put the use on par with "Cameras, Cell phones, Tablets, etc."

The x36 was not "rushed to market". That is an urban myth. But, it does represent a new design that incorporates what many were demanding of scanners - SD card memory. As with any new design, it's not perfected on the first try. And there were issues around the release time - specifically a WiFi dongle that didn't work from the manufacturer (hardly can blame Uniden for a third party's failures), backlight LEDs that didn't meet specs (same lack of blame), and a clock issue that I don't know the cause of. Both the dongle and the clock are new features that weren't in previous models, as was the SD card. And the LEDs were essentially new as well since the size of the display nearly tripled.

The above issues are public info posted by Uniden at the time it was happening.

I suspect these increased costs accounted for more issues with R&D capabilities. (or lack of capabilities)

UPMan posted a "roadmap" early on; the majority of which I bet has not been realized due to decreased finances. The causes of the decrease are things like having to fix the above mentioned issues on Uniden's tab. I only hope some of these can be covered by going back to the respective manufacturers to pay (or partially pay) for having to replace the bad parts they provided. we will likely never know if that has happened.

SD cards are, by definition, disposable items just like batteries and to a lesser degree antennas (but antennas ARE considered disposable items). I doubt the cards were ever intended to last forever. You can replace the stock card with better, more durable, cards. I do that and recommend the same. I don't disable REPLAY but for those who want to extend the life of the card that too is highly recommended.

Joe M.

When creating a FL (presuming Sentinel programming, since it simplifies things for this discussion), add only the specific talkgroups that you _want_ to hear into that list (Fire, LE, whatever). Turn ID search OFF, then you'll hear only what you want on that system. Much the same as adding only departments of interest when programming analog channels. You can use the avoid method, but to me that's sloppy and inefficient. And if you miss one or more, you'll be mashing the avoid button EVERY time you bring up that FL which only irritates. Take your time, be specific in what you program and understand the surrounding features.

In your case, using the East Bay system as an example (I used to work in the Bay Area, so I'm familiar with that system, now I'm retired and moved, so I feel better each day)...

create a list for "EB Fire", add ONLY talkgroups like:

Richmond FD
Oakland FD
Benicia FD   ... and so on

Turn ID search OFF (or other groups will be heard) for that FL. Then those listed are _*all*_ you will hear on that FL.

> find it that much easier to read than the Uniden one.

Not that I found. The manual is one of my very few gripes. A better manual would include specific examples, when to apply a feature and take a beginner by the hand through the process. It should also completely cover Sentinel use as well as front panel since most would be using the software (FAR simpler than button pushing BUT you still have to understand WHAT you're trying to accomplish and HOW to get there).

[Simplifying some of the feature access in Sentinel is another gripe, but we work around it. Finishing the engineering based tool for PC control is my final gripe; bring that up to date, add audio and it'd be AWESOME.]

The current manual demands a level of understanding that most noob simply won't get (even me and I read at a college level, WITH a technical background). Worse, it's in 'engineer-ese' so you really have to read it a number of times to get the concept, then having that, the intent. The mistake is that the manual was written by an engineer, not a user. It covers details, but not in a way that is understood by a non-engineer. The writer needed to translate what the engineer said into everyday speech then show how/when to apply the feature. This isn't a slur on engineers, but to be one requires a 'different' mindset and a writer fluent in both 'languages' needs to translate.

The simplified version that you'll find online is no better; it's just in a different format, provided in html instead of print. No help gained (same words, same everything).

A guide to features stating WHAT each feature/setting does with real life WHEN to use them and WHY examples, would be a great help for beginners. Lacking that, you must study, then try to apply the lessons and see if your setting works as intended, repeat as needed.

As the radio networks become more complex, the scanners will be too and the more the listener will have to learn to best use the tools at hand. The days of ordering crystals or simply punching in frequencies are LONG gone, unless you live in BFE; even then those days are numbered. Change happens.

For basic ops, use the zip code and service method. But for those of us that want specific things to hear (ONLY), more research and learning is required. The learning curve is steep, but in the end, once dialed in, it's worth the effort (the x36 is a great scanner or I wouldn't own three of them). Learning is the best way to keep the mind sharp and over time, one will appreciate the need to do that.

I suspect that the vast majority of SD-Card failures involve the loss of power during a read-write cycle. This can be devastating on any device, be it a scanner, computer camera etc.

Some devices have a buffer battery or capacitor to provide enough power to complete any R/W actions even if power is pulled impolitely. This added circuitry and devices costs money and is apparently not part of the Uniden products.

I have had 2 SD Card failures, both on my 436 and I can point towards power loss for both. That said however, I have at times had my 536 mounted in my truck connected to the ignition and over several years never had an SD-Card fail in it even though I wouldn't power off the radio before turning off the ignition. Of course I always keep a spare card in the truck, perhaps the mere presence of the spare card prevents a failure...

> The x36 was not "rushed to market". That is an urban myth.

Umm.. Don't think so.. They pushed it to market to get it on he street before Whistler got something out. Paul may say otherwise, but he has to, it's his job.

I like Uniden, don't get me wrong. But that's not going to get me to say a Duck is a Swan.

As for the memory usage, the use in many computers in tablets and the like is often as cache memory, often being rewritten probably more extensively than the scanner. From my observations thus far, I still think it's an environment issue, (voltage spikes, errand write processes, etc) that is causing the failures. I doubt seriously that more than 1% of the card failures are the cards fault.

While I've given background before a short version is, 40 Years Fire Rescue (for fun), 40 Years Broadcast Engineering (real job), 10 years Photo Journalism (Fun job). I own my company, self employed. And yes I did go to college for electronics design, (BSEET) and can do it when I want to.

Is there a reliable way to listen to and operate a 536 in my office/den from a chair on my adjacent patio? I would be using a nice Android tablet and my wi-fi router system or maybe bluetooth. The scanner would be about 8-10 feet away with a signal path through a large glass window to my chair on the patio.

Has anyone actually done this?

Thanks for answering my recent rash of questions.

Yup, that's gotta be it Rick, Uniden, in their infinite wisdom, spent their R&D money to develop a circuit that has the ability to sense when we have a spare SD Card close by... instead of addressing the question of SD Card failure.☐

I mean no disrespect to you or Uniden, just poking at the issue a little bit.

SD Card failures are reported by users, myself included, and cause us to wonder why. I'm sure Uniden has had their share of complaints also. But the difference here is we don't know how many cards have failed when compared to how many scanners have been produced... and Uniden does. Before any large business address a problem they first need to know if it's warranted. An analysis allows for a certain percentage of failures before any attention is given to addressing it. We, as consumers, submit our findings but there are many variables with this particular product that change from one user to another. Were we still using the factory supplied Card? Was it replaced with "like" parameters? Different parameters? Was there possibly a bad batch of cards used when the radio was shipped new? How do we power the scanner on and off? How do our power sources differ? The list of variables goes on and on. If Uniden does decide there is enough concern, they may run their own tests... within controlled parameters. That way, any study of the perceived problem will produce results that are vastly more accurate than what we might offer. And, based upon the results, they can have a more accurate understanding of first, if there actually IS an issue, and secondly, how much they might be inclined to tackle our individual concerns... meaning we might have experienced failures but for differing reasons.

Uniden, by their own admission, is tight mouthed about most of what they are up to. So we don't see much in the way of what, if anything, they might be doing to correct for this Card issue... or if in fact they see any issue at all. That being said, if Uniden did identify a common cause for the premature failures, I'm sure they would have made it known.

I also run a BCD536HP in my pickup truck with an automatic switching device that senses when the ignition is on or off, divorcing or supplying power to the scanner, which allows for me to not have to manually turn on or off the scanner using the radio's prescribed method. I haven't had a Card problem with this setup either. But my other BCD536HP I keep at home did need a new card. In my case, I swapped out the card with the one in my other BCD536HP or BCD436HP I own to learn if the problem was the card. And then, instead of trying to reprogram the faulty card, replaced it instead. Once a card is suspect, it's time to swap it out. It may play good after reprogramming but for all we know there could be bad boot sectors. And the cost of replacing isn't prohibitive so, why waste time trying to save it? (My two other scanners act as my "spare card".)

Nice talk,

Bill

Yes, while the Siren app has not made it to the Android platform, there are at least two ways to do this. Neither is 'pretty' but each works.

The first is listen only and uses an app called VLC (which you'll find useful for other things too). It will not allow control, but you can hear the scanner.

The other way is to use the control app (RH-536HP_MkII) on a PC (on the same network) for control and a second app (BCD536HP Audio Player) to pass the audio; then a third app from both the Android and PC called TeamViewer which lets your tablet remotely run your PC. You WILL find reasons to use TeamViewer, it's pretty cool. What you can do on the screen of your PC, you can do from the tablet, including the audio.

TeamViewer also all allows you to do this from anywhere on the Internet and it's how I run my ham radio station as I travel.

I've done both methods for scanning.

Teamviewer would work, but you'd also need a program like ProScan running on a PC. So you'd need a PC running ProScan, and then teamviewer on the tablet and PC...

It's also a fact. Whistler purchased GRE in September, 2013. The x36 series was released in January 2014, so it was in development long before Whistler was even in the picture. In fact, I suspect final testing was going on around the time Whistler entered the picture. Development typically takes over a year for a new model (maybe close to two years in some cases). Even the final testing takes months. We have all seen that first hand with the Whistler and Uniden DMR releases, and that was a (relatively) simple mode addition to existing architecture. we also saw it with the WiFi dongle. It took the OEM manufacturer several months to get the firmware to work right, PLUS the time they had prior to release (likely another 3 months - maybe much longer).

Aside from the fact Whistler just made existing models, 3 months is not enough time to develop, test, and produce a scanner, so there was no threat of competition. As it was, even producing the same models took Whistler the better part of a year to do.

So, the facts don't support your conclusion.

> I like Uniden, don't get me wrong. But that's not going to get me to

Even when it really is a swan?

There is a well known issue with people who remove power without turning off the scanner first - mostly in the case of the 536. When that happens, it is entirely possible to trash a card. This won't happen always, and some swear it will never happen to them, but it's poor practice just as it is when your PC is writing to the hard drive.

As for the cache use, I can't comment on that, but received audio data is constantly written, so I can't see how you can get more than constant. Of course, the scanner is not always receiving, but I know PCs don't write continuously to the hard drive.

Sounds similar to my experience. Not exact, but similar. Add some firmware development for a major two-way manufacturer, too. And my "Photo Journalism" was more in the form of videography (many decades ago when cameras had weight and commercial recorders were large).

WiFi and the app for remote control.

That close I might use that in combination with an extension speaker.

5107. Re: [BCD536HP] Best Outdoor Antenna Setup/Config??

Yahoo group: BCD536HP
Date: 2017-09-17 17:40:34 UTC
From: TLFerg53
Topic: 5082 Message: 5107

I've found the Diamond D-130J on-line but only the Ringo Ranger II to do a comparison on which might be the best for this location. And yes, we are basically VHF-Hi only here, at least for the time being. About the time I say that the local departments (fire and police) will make a major announcement of going digital, encrypted, and trunking.

The Army Corps of Engineers at Carlyle and Rend Lakes are UHF and Illinois State Police are on a STARCOM21, Project 25 Phase II system to which Clinton County uses.

My first police scanner was a crystal-controlled Regency from our local Radio Shack that I bought while in high school in the early 1970's, only could afford one crystal, 154.430, for the local FD's (the local PD's were on low band, 39.50). Rigged it up with a power converter to run in my '62 VW Bug, and a good friend of mine and I used to chase fire trucks, staying back 500 feet of course. And no, it didn't go on and off with the key, and there was no memory card I had to worry about becoming corrupted which required carrying a spare at all times. What happened to the good 'ol days??

No, you don't. I listed the two programs that will work under
TeamViewer (or one could still use VLC for audio, there are other
options too but it gets complex after that). All of those are my second
favorite price, FREE. (My first is when I'm paid to do/get something I
wanted anyway.)

I use the RH-536HP_MkII for scanner control and Audio Player for the
audio on the PC, both when home and when traveling and I want to hear
whats happening near home (mostly in heavy weather or fire season).

From there more options open up like stream it through a server, yet
retain remote control... but he only wants to cover the deck, FAR simpler.

5109. RE: [BCD536HP] When does a 536 croak?

Yahoo group: BCD536HP
Date: 2017-09-17 18:44:06 UTC
From: Dewey
Topic: 5072 Message: 5109

I fully agree with you concerning the micro SD cards. I have 6 Raspberry Pis (?Pies?) that have been running non-stop 24/7 from the same micro SD cards for close to 2 years, a couple are flight trackers, and the remaining ones are security cameras. The flight trackers are always writing flight-info and log data to the cards and the security cameras are always recording motion activated video and images to the cards, and none of those have had failures. (And yes, there are the occasional power glitches that will cause the Linux based Raspberry Pis to reboot without a clean shutdown, yet the micro SD cards have always bounced back without complaint). While I'm happy with my 436 & 536, I do think that there is a problem where the micro SD cards have been getting corrupted. However, we know that there are those who will always say that Uniden is NOT the problem.

> The x36 was not "rushed to market". That is an urban myth.

Umm.. Don't think so.. They pushed it to market to get it on he street before Whistler got something out. Paul may say otherwise, but he has to, it's his job.

I like Uniden, don't get me wrong. But that's not going to get me to say a Duck is a Swan.

As for the memory usage, the use in many computers in tablets and the like is often as cache memory, often being rewritten probably more extensively than the scanner. From my observations thus far, I still think it's an environment issue, (voltage spikes, errand write processes, etc) that is causing the failures. I doubt seriously that more than 1% of the card failures are the cards fault.

While I've given background before a short version is, 40 Years Fire Rescue (for fun), 40 Years Broadcast Engineering (real job), 10 years Photo Journalism (Fun job). I own my company, self employed. And yes I did go to college for electronics design, (BSEET) and can do it when I want to.

Tim,

That sounds exactly like me!

My first scanner was a Radio Shack Patrolman - also crystal controlled. I bought it while in high school in the early 1970s, too. I listened to it in my bedroom and later installed it in my 1972 AMC Gremlin. I, too, chased police calls with friends, my brothers, and even my mom. That caused me to finally decide on my lifelong career. I am now a retired federal agent (and still scanning).

Hi Everyone,

Looking for suggestions for the best outdoor antenna to use with a BCD536HP with the following in mind:

--- Have 40 ft tower to mount to
--- Monitoring analog VHF-High frequencies only, no digital, but need capability just in case.
--- Illinois State Police are digital, otherwise haven't heard that any of the local law enforcement, fire, or EMS departments are moving that way other than Washington County.
--- Would love to have 30+ mile range for Southern Illinois.
--- Live in the country where there aren't necessarily any restrictions (except an airport about 1 mile away as the crow flies).

Thanks,
Tim

I've had a couple failures. I don't think any were due to power glitches, but I can't say that 100%. But I CAN say 100% that none of the replacement cards have had the same issue, and they get used a LOT. In fact, I can recall only one poster who had a recurrence of failure after a replaced card. So, while that is not conclusive evidence that it's not a scanner issue per-se, it does hint that perhaps the OEM cards are not as robust as some others. BTW, all mine are SanDisk cards, but none I've purchased were base models. They are always higher capacity and more rugged duty cards. (Class 10 or better, SanDisk Ultra or Mobile Ultra)

If this were a scanner issue, I would expect the issue to recur with these other cards. So while I can't say the issue is NOT Uniden, my experience suggests that it is not. But, I do try to not power-down using unrecommended methods. BTW, I also don't have REPLAY disabled on any of my scanners, but I do use RECORD a lot.

Then again, when I use a card with a capacity of 16x the stock card, if the issue is wear I would expect it to last 16 times as long. Some of my cards are 64GB, some 32GB, some 8GB, and some stock 4GB. I don't think I have any 16GB cards for whatever reason. And yes, 64GB cards will work. I can't say the scanner will support the full capacity, and it was a PITA trying to find a FAT32 formatter, but they do work. I've used them since about month 2 after release and I have yet to replace one of those.

My first scanner was a Midland 4-channel VHF-Hi/Lo. Thought that was the greatest thing in the world to be able to hear that stuff. Clipped it to the passenger-side sun visor in my car. I was “the man” with that thing!

How did you buy a Regency scanner at a Radio Shack store? Far as I know, they only sold their own “brand”, though they may have been manufactured by other companies.

> My first police scanner was a crystal-controlled Regency from our local Radio Shack that I bought while in high school in the early 1970’s, only could afford one crystal, 154.430, for the local FD’s (the local PD’s were on low band, 39.50). Maybe he meant Realistic. Of course, RS has sold other brands including GRE, Whistler, and Uniden in addition to their Realistic and Radio Shack brands. I don't recall if they sold Regency or not. My gut says they did. I'm sure someone on the list remembers for certain.

Believe what you wish, but the rumor mill was all stirred up at that time that Whistler was going to release a new version of the GRE that was almost ready for production when they shut down in the very near term.

The x86 was pushed to market with incomplete firmware, non functional accessories, and several faults. To their credit, Uniden has worked hard to make up for this. Still it's very clear it was an early release. This turned out to be a very costly push to market for Uniden. I'm sure they will be a bit more cautious next time.

From: Bill Nolan
Topic: 5082 Message: 5119

Offered only as an amusing sidebar to this thread;

I guess you could say a window In my bedroom was responsible for my interest in scanning, and eventually, electronics. Back in the day, when I was in Jr High School, (I'm 68 now) there were no window air conditioners so the windows were always open/screened, allowing me to hear all that was going on in my town. The VFD was alerted by pole mounted neighborhood sirens which, by design, was supposed to awaken the VFD... not to mention the rest of the town! I heard the alerting siren plus the truck sirens when they left the fire station. I only lived about a mile from the station and got pretty good at guessing which way they were heading. But sometimes, I couldn't. And when you add to that, my ability to also hear the sirens of adjacent towns, mutual aid calls got the best of me! I had to know the what and where of it. My first scanner wasn't even a scanner. It was a tunable 30-50MHz Radio Shack Patrolman. FD was 33.94MHz and PD was 46.52MHz. I drilled holes in window sills (caught holly hell for it from my Dad) for what I thought was the best antenna installation... outside with a feedline. And the rest, as they say, is history.

I remember my most memorable scanner was a Regency dual band crystal controlled rig. It had two boards mounted inside, mine had a VHF low band board and the other was UHF board. It had two separate antenna inputs. I don't remember if Regency offered (but I expect they did) another VHF High band version, but you only had two bands available per radio. Each band had four crystal sockets. Since one of the adjacent towns moved off the VHF low band county frequency, that scanner of mine was the cat's meow! I was much older now, and a member of the VFD. My Chief asked if he could talk to the UHF adjacent town fire units during mutual aid calls and I replied yes... provided they had a receiver that could hear our low band VHF transmissions. A cross band arrangement was investigated... with both depts finally deciding to supply the other with one of their portables. But my Regency started the discussion and I got some credit for instigating it. My electronics schooling and amateur radio put me on a path of being the unofficial go-to radio guy which eventually led to my heading up a successful move off of our simplex VHF Low band county system to a repeaterized VHF High band system.

Those were the days!

Bill

That would be the PSR-900 mobile version of the PSR-800.

There were no rumors about Whistler doing anything before they purchased GRE's IP. In fact, the active search for someone to pick up the pieces from GRE had actually ended. Virtually everyone had given up.
So there were no rumors at all then out of nowhere Whistler stepped in.

All the issues you mentioned were explained in my previous email.
There was a lot of blame to go around, but most of it was beyond Uniden's control. I know some made the argument at the time that they should have stored the stock and released it when everything was resolved, but you just cannot tie up your inventory like that. Anyone in business will tell you the same thing. All the issues did not affect the core performance with the possible exception of one issue which was not discovered until last year.

The x36 was not rushed. Yes, there were delays on some aspects, but it was released on schedule (if not maybe a little late).

Now, the DMR upgrade was an old fashioned "space race" between Uniden and Whistler. Both of those were "released" early, but all parties involved KNEW ahead of time they were beta releases.

As to what I wish to believe, I'll believe the facts.

I can speak only to my own experience, having worked at Radio Shack a few times during my time, but I’m pretty sure that RS never sold “Regency” scanners. In fact, until the late 1990s, they never really sold ANY other bands, although I did see “RCA” television sets and Casio keyboards and digital cameras, at some point. There were a few “store” brands such as “Realistic” (for radios, audio components and such), “Optimus” (stereo speakers) and “Knight Kit” (electronic kits), all of which eventually were phased out and replaced with “Radio Shack” on pretty much everything.

I forgot about the fact franchise stores can sell
anything they want in addition to the RS line.

You seem to be believing what you want, yourself.

As Joe points out, GRE announced that they were closing GRE America and getting out of the scanner market. It was about a year before Whistler bought the IP rights to the scanners. The PSR900 was seen on only in prototype form at CES and was never released.

It took Whister about two years to redesign the existing scanner lines and ramp up production. The TRX scanners are the only totally new line that Whistler has released.

The x36HP was released with a lot of "In the future" upgrades which took longer than anyone, including Uniden, anticipated.

I'd think that a person with the level of experience you claim to have would know that, but then again, it seems that your mind is made up and you prefer not to be confused with the facts.

Really, even the TRX are PSR-800/900s with minor tweeks - much like the BCD396XT was a tweek of the BCD396T and the HP-2 is a tweek of the HP-1.

Whistler has yet to really make a new model, and from what I hear it might be a while before that happens. In fact their line may be reduced soon. Treat these last two points as rumor at this time.

I guess the TRX are upgraded PSR scanners, but I've never really thought of that.

I hope that if they "scale back", it's only by discontinuing the PSR500/600 clones as those are pretty long in the tooth.

I don't know that I'll ever buy a Whistler scanner, but having competition is good for the hobby so I hope someone other than Uniden keeps making scanners.

I would like to see a Phase 2/DMR capable scanner to replace the WS1040 and 1065 like Uniden did with the 996/325. There are things I like about the older GRE style even though I am far more a Uniden kind of guy. (I detest the TRX series if it matters.)

Topic: 5082 Message: 5128

Below is a link to a YouTube video of the Regency scanner I purchased around 1971 at our locally owned Radio Shack franchise store. Yes, it was a Radio Shack store, and Kenny did sell other brands. When he retired several years ago, and none of his family wanted to take it over, he sold it to Radio Shack along with the RS store he owned in Mt.Vernon, Illinois, and quite possibly all non-Radio Shack merchandise disappeared from the scene.

The Radio Shack store in Nashville, Illinois, is also run by a long time friend and he, being a franchisee, is not required to carry strictly RS merchandise. Can give you the phone number and name if you want to call and see for yourself.

Regency Scanner video: https://youtu.be/ogwc0G1VejM

If the 996P2 had come out first, I might have bought that instead of the x36HP. That being said, I like a lot of the features of the x36HP and do not regret the purchase.

5130. My 536 on my patio problem resolved !

Yahoo group: BCD536HP
Date: 2017-09-18 22:03:18 UTC
From: neil.neilbell@...
Topic: 5130 Message: 5130

A the suggestion of a previous response I downloaded the "TeamView" software (free for personal use) and installed it on my PC and mt Android tablet.

I was already a user of the Proscan software on my 996P2. I started up Proscran and then TeamView. Connected the Tablet to the PC and easily went out on my Patio and other places in my house and voila - I easily run Proscan on the PC using TeamView, can change what ever I want on the scanner software using the tablet. The image on the tablet is exactly the same as that on the PC. The audio comes through just fine. I tried running Freescan and it can be run from my tablet.

Neat solution and my thanks to the member who mentioned TeanView! Issue is resolved and it works great!

Neil Bell, KJ6FBA

I think is 536 is a great scanner, but I think Uniden will need to go to a SDR platform in any new base scanner. Would be a mistake to ignore it. Price will be a tough issue, when you can get a SDRPlay for under $200...but it isn't a scanner, in a strict sense.

From: MCH
Topic: 5072 Message: 5133

Agreed 10000%. I've mentioned this to UPMan, too.

And yes there is a great difference between a self-contained unit and one connected to a PC - especially when dealing with portable units. If you want to get "nit picky", you can even compare it to $10 SDRs for a price point. Of course, some PC SW is shady legal-wise, and I'm sure Uniden will use licensed copies as they are now.

Can you imagine a scanner with a full color FFT-capible display? I've been promoting for years a scanner with a form factor akin to the iPhone series with a full display and touchscreen. In fact, that might have been one of the triggers for the HP series. But, its display is too power-hungry. They would have to use one similar to the iPhone, but those are much more expensive.

BTW, all of the above is "dreaming", and is nothing new since I've posted the same thing for years minus the FFT part. I have no idea what they have planned for the next models or any timelines.

On the hardware, I would hope it's closer to the Airspy than SDR Play. The Airspy is much more "bullet proof" RF-wise. I compared the two side-by-side and it was an "unfair fight". And the $10 dongle didn't even make it to the beginning of the first round. The display was a pure porcupine. The SDR Play was much better, but had some aliases and images. The Airspy was very close to perfect. I'm looking forward to the Airspy HF+ which will reportedly eliminate the need for any gain controls; max gain (sensitivity) without overloading.

And a scanner with a spectral display like Spectrum Spy would be incredible - especially combined with Close Call. Even TDMA signals would not be able to hide. But, enough tech talk, as I'm starting to drool thinking about the possibilities. 8-))~~~~~~~

5134. New SD cards --- was: Re: [BCD536HP] When does a 536 croak?

Yahoo group: BCD536HP
Date: 2017-09-19 03:40:07 UTC
From: MCH
Topic: 5072 Message: 5134

Just as a point of fact, or belief on my part ;-> (cough), I was getting the SN off a brand new 436 today and the OEM card was *not* made by SanDisk. I don't know the reason for this change, but it's possible it's more reliable than the old one. SanDisk is a reputable name, but it's odd Uniden changed sources. It's also possible it is less expensive, but considering the failure rate of the SanDisk cards, can it really hurt to try someone else?

A third possibility is that SanDisk is simply not making 4GB cards anymore.

It is highly unlikely the card was changed by anyone
(to put that theory to bed before it awakens).

I just checked a new 536. Same thing.

I don't know when this change was made.

Thanks Bob. That's what I thought. Actually I have that plugged into the audio control of Proscan so I can record over Wi-Fi.
Evidently there is a problem with the Siren android app. (Bummer!)
For now I'm going to go the Teamviewer route as suggested in an earlier post, and hope that Uniden gets the android app squared away.

5137. Zero Reception on DMR

Yahoo group: BCD536HP
Date: 2017-09-20 11:32:47 UTC
From: xtraham@...
Topic: 5137 Message: 5137

I'm an owner of both the BCD436 and 536HP. I've used them successfully to scan PD/FD/Med, etc with no issues. I live on Long Island where there's plenty of traffic to receive from the island and New York City.

I am now trying to get the scanner to pick up DMR (yes I purchased the upgrade). Specifically the NY Metro DMR Repeater Network... go here to see it:

http://www.k2hr.com/2017%20Repeater%20page.html
http://www.k2hr.com/2017%20Repeater%20page.html

I've programmed my scanner with DMR as follows:
One frequency DMR
Entered the correct Color Code(s)
Entered the correct frequencies
Entered the correct Talk Groups and ID's for each repeater

So far, I'm hearing nothing. I'm using the same antenna system on the 536 that I use for the conventional frequencies, of which I hear a lot. The antenna is a Diamond discone, mounted at 20'. Again, I pick up plenty of NYC traffic with no issues for the conventional frequencies. It would stand to reason I should be hearing DMR.

I've read on RR that I should set the Digital Threshold to "Manual" and a level of 5, which I will try next.

Any ideas on what I am either doing wrong, or things I should try?

Thanks.

Yes, FL and Service are enabled. Since I wrote my original question this morning, I am receiving limited DMR. It's either that there's not a lot of DMR traffic in the NY Metro area, or the range of DMR is nowhere near traditional systems.

Thanks for the help.

I've programmed Amateur Radio only. I'm picking up traffic on a repeater about 10 miles away, but nothing from Manhattan. I can easily pick up traffic from NYC PD and FD, but that may be due to their antenna height, now that I think about it.

That's also true... DMR shouldn't be compared to analogue, unless you are asking which has a greater range, given all things equal I'd expect the analogue will outdo DMR.

From: genelp@...
Topic: 5137 Message: 5143

I have had the same problem up here in Maine. At the same time, I am also a ham, and have been trying to get used to the programming culture of the new type DMR radios. I am not all that technically challenged, but I must admit that it has been a long and frustrating learning process. However one thing I did learn, that may be a clue about what you/and I have been experiencing with our scanners, is that many, if not all, the programmed talk groups on a Ham DMR repeater must be activated first before you start hearing anything. I think the term is UA. User activated. That means you set your radio to the appropriate channel of the repeater, like Nationwide 3100, and then PTT to wake it up. I may be totally wrong about this, but I don't have a lot of local expertise to lean on up here. Thus, since our 536's are only receivers, and not transmitters, we are at the mercy of the local ham activity for the ham repeaters. Now whether that is true of other DMR systems, I don't know. I have my scanner programmed to receive other business DMR, and frankly have not heard a lot. But I did hear some communications. Forgive me if this is way off. But its a guess on my part. Any thoughts? 73 de Gene W1GLP

Topic: 5137 Message: 5145

My experience is that as signals get weaker analog is the
first to get noisy, then DMR drops out, then analog drops out.

But, the point at which DMR drops vs analog gets
too noisy to understand is not that far apart.

Yes, I updated the firmware to my Tyt 2017 last week. 3.036. Unless another one came along.

Yes, the latest firmware is installed. I think the fact that I'm hearing some traffic makes me confident that I programmed correctly. it's just a matter of analog vs DMR.

Thanks to all for the suggestions and help.

Scott

Or they could be using hotspots; mine has a whopping 20 mW output. Make sure you have the talkgroup set to search (allow all) and everything else is triple checked.

DMR being a subset of ham radio, isn't terribly active but the low prices of the radios is increasing popularity. With some exceptions, the radio could be on for hours with little or no traffic. The good news is that most conversations are not the typical benign chatter.

Rick WA6NHC (3106, 31068, 3116, 95150 when I'm on).

The ranges are slightly improved with digital but with differences.
With analog, you'll get noise when weak, while digital just stops or
becomes Max Headroom.

From: Rick WA6NHC
Topic: 5137 Message: 5150

Close. Repeaters (and many hotspots) typically default to a specific (group of) talkgroup(s) with no user intervention on one of the TS. One TS (Time Slot) is often dedicated for Static Talkgroups (all the rest).

To enable a static TG, one must give a short transmission on the TS with the desired TG, to tell the repeater node to connect the network server for that TG. Then it's active, but if unused for a period of time (usually about 20 minutes), it drops that network connection.

THIS is why you keep the TG search function active; you don't know which one will be activated.

Yes, there is a learning curve, but the flip side is that once it's attained, the world is at your fingertips.

So as listeners only (x36HP), we're at the mercy of the users. Most still have daytime jobs and a life, DMR is a very small user group (worldwide about 75k ham users) so there is a lot of quiet time. Which I find appealing; I can keep in touch but not be required to hear Molly ask Joe to pick up dinner on the way home (for that they can simply use an unlisted TG, which makes it a little more private).

Topic: 5137 Message: 5152

Did you assign a service type to it? (Ex: Fire Dispatch, Fire Tac) And then assure that type is on?

On Sep 20, 2017, at 7:32 AM, xtraham@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

I'm an owner of both the BCD436 and 536HP. I've used them successfully to scan PD/FD/Med, etc with no issues. I live on Long Island where there's plenty of traffic to receive from the island and New York City.

I am now trying to get the scanner to pick up DMR (yes I purchased the upgrade). Specifically the NY Metro DMR Repeater Network... go here to see it:

http://www.k2hr.com/2017%20Repeater%20page.html

I've programmed my scanner with DMR as follows:

One frequency DMR
Entered the correct Color Code(s)
Entered the correct frequencies
Entered the correct Talk Groups and ID's for each repeater

So far, I'm hearing nothing. I'm using the same antenna system on the 536 that I use for the conventional frequencies, of which I hear a lot. The antenna is a Diamond discone, mounted at 20'. Again, I pick up plenty of NYC traffic with no issues for the conventional frequencies. It would stand to reason I should be hearing DMR.

I've read on RR that I should set the Digital Threshold to "Manual" and a level of 5, which I will try next.

Any ideas on what I am either doing wrong, or things I should try?

Thanks.

Scott

In south Florida and most of the east coast of Florida FIRE is not encrypted. Many police departments are moving to encryption. The city of Jacksonville Fire and Police are encrypted.

They don't need any other reason than "Because they can!"

If the public doesn't object, get involved, it is likely to happen. Even though there is no specific reason identified.

But there are also systems that Dispatch in the clear but all the usual common messages such as "Responding", "Taken arrival", "Returning" have been canned and converted to data bursts. They just push a button and the data burst is transmitted. You could decode but it's another added expense.

Ahhh... very true.

A competitor of ours sold a county a new paging system because "the FCC was pulling their LOW BAND license due to 'rebanding'". Of course, we showed them a confirmation letter from the FCC that stated that not only is Low Band not affected by rebanding, but that Low Band licenses are not being pulled. They didn't believe the FCC letter. Know what that tells me? Someone was getting a kick-back.

Then, between the time the contract was signed and the system was installed someone at the county made a big mistake - they RENEWED their Low Band license and it's good for another 10 years. Dang. If the FCC was going to pull a license, why would they renew it?

Oh, and get this - it's a TEXT-BASED dispatch system (think 80's type alpha pagers). That's right; in this era of texting-while-driving outcry they are forcing first responders to TEXT SERVICES over voice dispatch!

So, there are a lot of unethical salespeople who will say anything to get a commission. Encryption upgrade? Oh - you NEED that so my commission increases... er... I mean so you can tell the officers their security is of paramount importance. Nevermind the fact that they will have a lot fewer people on the lookout for the suspects or watching their backs. Nevermind the fact that the public will have no clue about what is going on around them. Why do they need to be concerned with their safety? That's the job of the government!

And you wonder why crime is exploding these days. The criminals know there are fewer eyes and ears, too! And the public is arming themselves in record numbers due to the uncertainty.

<soapbox mode off>

Yea - encryption is wonderful... What happened to transparency?

Joe M.

5160. Scanner for sale

Yahoo group: BCD536HP
Date: 2017-09-24 00:58:51 UTC
From: Tim Eichelman
Topic: 5160 Message: 5160

Hi all ,
I’m selling my Uniden 536HP Digital scanner Package. Included in the sale is the scanner has had the clock and display upgrade completed. Comes with power cord , internet dongle , antenna and external speaker. Radio has never been mobile in a non smoking environment no pets and well cared for.

This comes stock with NO Other voice upgrades. I bought a whistler this is the reason for the posting. I refuse to pay for the upgrades to uniden

I prefer postal money order I do have a PayPal add the 3% for the charges and fees. I cannot fathom paying PayPal and lose money. I ship usually the same day as payment arrives other wise it will be next day with tracking and insurance provided.

Shipping cost I will ship FEDEX unless you specify different shipping provider. Cost will be 20$ to the lower 48.

I’m asking $425 for the package however I’m also a reasonable person to work with. If you come to me with a REASONABLE offer I’ll consider it. I always communicate with the buyer so you don’t have to worry about not hearing from me.

Now returns!! I don’t accept them , the radio will not be DOA as you can see in the pictures it is in good shape now if it’s damaged in shipping that is where the insurance come into play. I will insure this for the full cost of replacement in case of damage.

Any questions contact me Read Less

Well, maybe some PIT BULLS might, because, you know, they’re all out looking to cause trouble, right?

Initially, the FCC intended to reclaim frequencies when a service moved off them. But that changed. And the radio dealers just didn't give their customers the full story. They tried the same thing in my town. But when I heard what they were up to I got involved.

Motorola stated there were no VHF or UHF freq pairs available to assign for a repeaterized system in the portion of the band allocated to FD's. They pushed for a 800 MHz trunked system, running into the millions of dollars. I sat down with the town fathers and told them the system supplier was in business for themselves, they were representing their interests, not ours. They simply did not have our best interests at heart.

They asked two questions of me... "If that is true, what can we do?" We (the FD called for a fix when using portable radios) were on a simplex VHF Low band frequency at the time, asking for a VHF High or UHF Repeater system. But the Motorola sales people said no, nothing was available. I knew of a pair of VHF High band freqs that would be reallocated to us. All we had to do was submit our application to the FCC. The second question was "How do we do that?" I told them I could do it. Or Better yet, since I'm not in the business, have no insurance bonding, they should hire an independent communications analyst that IS bonded and will work for the town, protecting OUR interests. And, although an independent consultant is not cheap, it was a hell of a lot cheaper than the suggested trunked system. So they hired the guy I suggested. He did an in-depth study of our present system and submitted recommendations that were an exact copy of what I had suggested, giving me credit for using my work. And that's all the credit I received for saving the town millions of dollars. But my intent was getting an independent repeaterized comms system for the FD, separate from the PD. I accomplished that... and those "in the know" were aware of my input. I was satisfied. (Trunked systems were in their infancy at the time, I did not trust them.) I did not want both depts to become dependent on the same comms system. In our town, when the PD (analogue 800 MHz Repeater) needed comms assistance, they called the FD. (This pre-dated cell phones- pay phones were the fall back plan.)

The FD philosophy was and still is to "Assure the ability to bring everything they own with them, if need be, in an effort to act independently, including a comm system. Our new VHF High band Repeater system included high power mobile radios that had no problem reaching from one side of town to the other simplex in the event our Repeater went down. The 800 MHz system the PD ran did not have that capability, so, they would ask us to help with at least the simple stuff like contacting our shared Dispatch center.

Radio dealers are in the business of making money for themselves. Nothing wrong with that... we live in a capitalistic society. We just need to understand that and protect our own interests.

Bill

On Sep 23, 2017, at 9:11 PM, MCH mch@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

Ahhh... very true.

A competitor of ours sold a county a new paging system because "the FCC was pulling their LOW BAND license due to 'rebanding'". Of course, we showed them a confirmation letter from the FCC that stated that not only is Low Band not affected by rebanding, but that Low Band licenses are not being pulled. They didn't believe the FCC letter. Know what that tells me? Someone was getting a kick-back.

Then, between the time the contract was signed and the system was installed someone at the county made a big mistake - they RENEWED their Low Band license and it's good for another 10 years. Dang. If the FCC was going to pull a license, why would they renew it?

Oh, and get this - it's a TEXT-BASED dispatch system (think 80's type alpha pagers). That's right; in this era of texting-while-driving outcry they are forcing first responders to TEXT SERVICES over voice dispatch!

So, there are a lot of unethical salespeople who will say anything to get a commission. Encryption upgrade? Oh - you NEED that so my commission increases... er... I mean so you can tell the officers their security is of paramount importance. Nevermind the fact that they will have a lot fewer people on the lookout for the suspects or watching their backs. Nevermind the fact that the public will have no clue about what is going on around them. Why do they need to be concerned with their safety? That's the job of the government!

And you wonder why crime is exploding these days. The criminals know there are fewer eyes and ears, too! And the public is arming themselves in record numbers due to the uncertainty.

<soapbox mode off>

Yea - encryption is wonderful... What happened to transparency?

That's slightly different. Was your town told they had to move because they were losing their current system's license?

I've never heard Low Band was being taken off Land Mobile.

BTW, that must have been a while ago because there have not been "FD frequencies" for a couple decades when the FCC consolidated all PS frequencies to one pool.

Another funny story (SAME county involved). We sold a VHF repeater system to multiple communities in the densest region of the county. The county EMA/911 people said they HATED repeaters and would never want to use them (the PDs loved the fact they could finally talk to each other without going through the county). Today the entire county is on a trunked 800 MHz P25 system. Virtually all channels are repeated!

So, repeaters are OK when sold by company X, but not company Y. Or maybe it was just a NIH syndrome (Not Invented Here - the VHF repeater was not the county's idea, so it was a bad one).

Joe,

Trunking;

My opinion at the time was that trunking was at best, problematic. The few systems in service at the time in my area all exhibited lost calls (they came to refer to this problem with a phrase... "The computer ate my transmission!") and repeater dropouts. In the fire service, a lost transmission was not tolerated for those reasons, but oddly enough, a dead battery was an acceptable reason. It didn't matter if it was just something new and not totally trusted or incorrectly operated. When a 150 man Department doesn't like something, bucking them on the issue gets you nowhere.

My present opinion regarding trunking has changed to one of acceptance. With the proliferation of trunking technologies, it's impossible not to accept them-No one can ignore them just because at one time we didn't like them. And the reliability has improved vastly.

Bill

Today, it's a whole different story.

As a former firefighter and line Captain who listened before, during and after my tenure, I can see both sides of this discussion.

While they are public agencies, not EVERY communication is publicly available nor should it be. For example, not every word in the fire/police station is for public edification, written or oral; including personnel matters, investigations or similar. In short the public has no right or need to know every detail and in many cases it would be highly detrimental to the ability of the department to function; it's the results that matter. When a radio is the means of communication, encryption can keep some things informed to the group that needs to know, limiting others.

On SOME calls (SWAT, HazMat, MCI), there are occasions that words need to be said, but a listening public (or media) could easily get the wrong idea or inference and some information needs to be kept contained (for example, to avoid a misinformed panic). Imagine the crush arriving at the scene of a school bus accident that was heard on a scanner. The worried parents, friends and relatives presence could easily exceed the LE ability to contain the crowds, understandably wanting to know if their child was involved. It would slow the response, block access and delay treatment; blame being placed on the agencies in play.

Not every scene location has cell phone coverage, nor can you talk to multiple folks at the same time. When able, cell phones are useful (ordering more staffing or equipment without raising flags or alarms to a listening public; i.e. multiple ambulances, body bags or the like).

Do I like or want encryption as a listener? Absolutely not, with the exception of some (mostly LE) exclusions; like everyone else, I want to know what is happening and what threats are involved (and being fluent in the lingo, I also listen for the stress level, words chosen; it's a compilation of things I hear). I also know that in the stress of the moment, flipping an entire team onto an encrypted channel for secure traffic would delay the response; so leaving it encrypted would be 'normal'. This would include any other parts of a response (ambulance, coroner and so on).

Do I understand the need for encryption, you betcha! Some things need to be unheard by non-attendees when it's hitting the fan. Some language may be department lingo or shorthand, easily misunderstood by an outsider.

Encrypting most of the state... strikes of something shady (what are they hiding) but then so does using a proprietary protocol with an obscenely priced 'license'; too high for the casual listener, to hear what is said. If there is truly a need, most if not all agencies record

the clear audio for later review, investigations of malfeasance or simply for liability protection; so it's available.

I'm not taking a side, just explaining how I see each side. I don't like taxes but just like encryption, it's tough to avoid and there are valid reasons for it.

One of the things that has not been mentioned, and probably for good reason, is the effect of social media today and how it plays into the scene. Encryption would cut down the rumors and innuendo on social media, or would it? Another potential can of worms we didn't use to have to worry about in the "old days".

Tim

While reviewing this thread, and what I had written, I realized I was guilty of "castle building", where I was trying to make myself look good in other reader's eyes... propping myself up if you will. It was not my intent to mislead but just the same, wrong. I am here to apologize and set the record straight.

I wrote; "In my case, while it can be expensively prohibitive, (buying more than one of the same scanner), I opted to because of the complex nature of our scanners."

I wrote that as it related to SD Card failure problems, where a spare "mirror" programmed card was the smart thing to do, or in my case, duplicate radios. But my using card failure as a reason was incorrect. Because, at the time I purchased my 3 scanners (two 536's & one 436), there were no "red flags" associated to SD Card failures that I was aware of. I guess my ego got the better of me... I wanted to pat myself on the back, my giving the impression buying two identical radios would guard against SD Card failure! While true, it does, I never gave SD Cards a second thought when I ordered the radios. So, my giving the impression that I knew in advance of a card issue was completely wrong. My apologies to the group. (To this day, I have no knowledge of IF the SD Card IS an issue... only that there are those who have had problems, the causes being varied which makes it difficult to form an opinion. But, I also have amateur gear that uses cards and have had no problems which raises the question... Could it be an issue with HOW a particular piece of equipment handles its care and feeding of SD Cards?)

All in all, it's a small point I make here, but I felt I needed to follow my own advice when submitting to the groups, only factual and honest input. So, I'm not as smart as I let on to be... and offer my apology for misleading the group.

Bill

Having been a poster to a group of some 12k members (one county), I can say that social media output depends on the knowledge and writing ability of those involved.

I know what to listen for. I understand the point in time of the call as it progresses, the lingo, been there, done that, have the scars to show it. I would post an informed translation so the members would be best informed to make hard decisions (when to pack, when to run, which way and how fast; when is it safe to return home, from a wildfire as an example). Along the years I did this, I also TAUGHT others the lingo, passed along insider info, WHAT to pay attention to and what to ignore as I encouraged them to also get scanners (an informed public is a safer public). This was partly me being selfish, I got tired of explaining, so teaching them was the simplest means to less noise. My tenure there was a tight ship, I kept the BS level and chatter to a bare minimum (benign dictatorship, NOT a democracy). See the header, if interested click on it to see more, just the facts and if I guessed, it was informed as such (and usually right). It drains a tremendous amount of time, each day.

Other groups posted what they thought they heard, often mistaking a phrase as something more than the intent, if they heard it correctly at all. Spreading that, started and inflamed panic. There was rant, rave, panic, confusion and outright lunacy.

My group was known for being honest, accurate and no BS; the go to place for rapid education on an event. They tolerated me being an intentional curmudgeon, because they could get up to date accurate info that affected them NOW. And in the quieter times, with limited chatter, they learned things (mostly as my commentary). It was an online classroom and newsroom.

Sadly, the panic and worse lines of groups are more common. People trying to 'help' while their main interest is raising their importance (actually their ego; I have none, it's not helpful) or puffing up their status points. I quit from lack of qualified help (it was taking 18-20 hours a day in the summer) and I have also moved WELL out of that area (part of my life plan).

Since the panic drivers are more common, social media CAN be a useful tool but rarely is.

For example, not every word in the fire/police station is for public edification, written or oral; including personnel matters, investigations or similar. In short the public has no right or need to know every detail and in many cases it would be highly detrimental to the ability of the department to function; it's the results that matter. When a radio is the means of communication, encryption can keep some things informed to the group that needs to know, limiting others.
>

Agreed. Not every communication needs to be available to the general public, however for the most part, all communications that are general in nature or run-of-the-mill routine, those should all be “in the clear”.

> On SOME calls (SWAT, HazMat, MCI), there are occasions that words need to be said, but a listening public (or media) could easily get the wrong idea or inference and some information needs to be kept contained (for example, to avoid a misinformed panic).
>

I agree, as well. SWAT, maybe even vice, drug, gang operations, etc., should probably be encrypted or scrambled because those individuals and groups these officers are looking for might very well be “listening in” and they shouldn’t know what’s about to come down on them. Average Joe Citizen does not need to be listening in on these comms, as a general rule.

> Imagine the crush arriving at the scene of a school bus accident that was heard on a scanner. The worried parents, friends and relatives presence…
>

A legitimate concern, however, it is unlikely that the average “parent”, “friend” or “relative’ would have heard this on their scanner or if they hadn’t heard the initial callout, would go into their “radio room” and flip on the scanners.

> Not every scene location has cell phone coverage, nor can you talk to multiple folks at the same time. When able, cell phones are useful (ordering more staffing or equipment without raising flags or alarms to a listening public; i.e. multiple ambulances, body bags or the like).
>

Although I don’t like that this has happened, most all paramedic/medical communication is done by cell phone or by “data” (MDT, etc.) for purposes of patient privacy (so they say).

I used to listen to the paramedics talking to their base hospitals all the time but haven’t heard a thing on those “MED” channels in about 20 years. Why? Cell phones, primarily.

> Do I like or want encryption as a listener? Absolutely not, with the exception of some (mostly LE) exclusions; like everyone else, I want to know what is happening and what threats are involved (and being fluent in the lingo, I also listen for the stress level, words chosen; it's a compilation of things I hear). I also know that in the stress of the moment, flipping an entire team onto an encrypted channel for secure traffic would delay the response; so leaving it encrypted would be 'normal'. This would include any other parts of a response (ambulance, coroner and so on).
>

Again, agreed for certain “sensitive” communications, but the routine license plate checks, and most “general” things should be “in the clear”.

> Encrypting most of the state... strikes of something shady (what are they hiding) but then so does using a proprietary protocol with an obscenely priced 'license'; too high for the casual listener, to hear what is said. If there is truly a need, most if not all agencies record the clear audio for later review, investigations of malfeasance or simply for liability protection; so it's available.
>

I see the purpose for having SOME encryption, but for specific sensitive situations, and not as a general rule for everything.

No raids should be planned "on the fly" or "over the air". The only thing they should hear on the radio is "Go! Go! Go!" and by then their scanners will do them no good. That said, I see no reason to object if these channels are encrypted (other than the fact it adds a layer that can fail which jeopardizes officer safety if someone doesn't hear the command to go).

No different than when the local news services report it. Should they be prohibited from reporting? Unless you block them, you have the same issue.

20 years? I still hear them daily. As long as you don't mention names, it's OK. Another factor for the reduction is that EMS is becoming better. In the 70s, you had the "load and go" mentality which means you get them to the hospital ASAP - period. These days, EMS is much more highly trained and many issues are dealt with enroute. They don't have to call for instructions as often. While once an EMT was the cutting-edge training level, it's now an entry level requirement in many places - even for drivers.

Add to that the fact they fly critical patients in helos that are staffed by nurses and sometimes doctors, and that further reduces the need for emergency treatment on the road.

You don't see nearly the number of high speed transports to hospitals compared with the past. The rush is to get TO the patient. Once there, treatment is calm, professional, and thorough. There are still cases where transport time is critical, but many of those fall under the "air transport" mentioned above. There are increasingly fewer times when a hospital rush is required.

Ambulances are increasingly becoming mobile ERs.

>> Encrypting most of the state... strikes of something shady (what are
>> they hiding) but then so does using a proprietary protocol with an

If it's not "accidentally erased" or "lost". But, how do you know to ask for something when you don't know it exists? Do you ask for the recordings every day? This is the paradox with recordings; You don't know what you don't know. I'm all for recordings, but they are not replacements for transparency.

How does the fact recordings exist protect me by knowing there is a string of burglaries in my neighborhood? Or that the store down the street just had an armed robbery?

Encryption will continue to flourish as long as the public accepts the loss of transparency. Then when they realize what has been lost, it will be "too late". Prevention is much easier than reversion. Once they have encryption, they will not easily let it go.

I think Joe is right on most, maybe all, his points. I have my oldest daughter as a supporting point: She has 25 years experience as an ER nurse and earned a certification as an MICN (mobile intensive care nurse). She went on Helo calls and ambulance runs and often gave important urgent care, talked to MDs on the radio and provided the critical triage function so the ER was fully ready when they landed. She loved her work!
So Joe's point about "load and go" is very accurate.

Thanks, Neil.

The downside I didn't mention is this: EMS is heading for a crisis. As the requirements increase that is great for the patients. But frankly speaking who would want to work as a Paramedic when with just a few more classes they can gain a big pay increase in an ER? I see EMS as being taken over by the hospital systems at some point, and the staff will have to take shifts working in the "mobile ER". Many places already have hospital-staffed paramedic units.

Your thoughts on the above, Neil?

But there is hope on the horizon (a forewarning - this IS intended as a joke):

I don’t know where any of you are located but here in California, at least here in Southern California (particularly the Los Angeles area) we do not have “hospital-based” or “hospital-staffed” paramedic units/ambulances. What that means is that some hospitals, such as UCLA Medical Center, may have their own ambulances with their names on them, but these are only for IHTs (Inter-Hospital Transports). They do not have a contract with the city or the county to go out on general medical calls in the community. Maybe in some smaller towns the hospital-based crews may do that but not here in the “big city”.

It’s not all about how much they’re paid, it’s what they are able to DO. Paramedics and RNs each have their place in the system. You generally won’t find Paramedics employed in the hospital ER (you may, but they won’t be working as “Paramedics”, but as “ER Tech” or some other title. Paramedics work in the “field”, and can work on their own insofar as their “standing orders” and physician control allow them to. RNs are “clinically based” (e.g., hospital or office setting). Having said that, Los Angeles City Fire Department recently put out in the field a mobile unit staffed by NPs (Nurse Practitioners). The unit is called “NP1” and is currently servicing a certain area near the downtown area. Don’t know how successful it is, yet.

You missed the point.

The point is that Paramedics can take a few more classes (training) and earn much more as a nurse working in the ER. There is not much difference in the training, but there is a big difference in pay. So what is keeping Paramedics from taking a few classes for that big pay increase? What is the attraction keeping them making the upgrade? It's not the training. I doubt it's the desire to make less money.

Heck Forget the local news, It was on Facebook and Twitter while the bus was still coming to a stop.

I recently worked a crash with Injuries that happened right in front of me, one vehicle slid within inches of my bumper, I got out and checked for injuries, had 1 non life threatening injury. (which was good for a medium speed head on). I look up to see at least 15 people gathered there at the crash, every single one of them on their phones. So I ask who's on the phone with 911? NOT one of them, I was the first call in when I called myself and that was after assessing 3 potential patients. Upon later checking most were on social media of some sort telling about the crash.

The first thing they tell you when coming upon an emergency is
to point to someone who has a phone and tell them to call 9-1-1.

Of course, I would radio in, but that's what I would do if I didn't have
a radio on me.

Just try calling 911 first.. You'll never get a chance to do what needs to be done.

I guess I should have figured, my response wouldn't be up to your standards.

Also the call for help first is for initiating CPR.

That's why you TELL someone to call them. And that is the standard of the Red Cross and my local instructors, not mine. That is to say not authored or originated by me.

Yes, CPR is an emergency, too. The same rules apply for the same reason. You free up yourself to do what needs done. If there is nobody else around, you call and put it on speaker while you take action. But, that is a compromise case.

Another reason to tell them to call first: Say it's an oxygen deprivation event (and nobody else is that close to them). If you wait to tell them to call you may be on the ground before you have the chance. Now you are both in danger if nobody takes the initiative to call. I carry many things with me. SCBA is not one of them.

Again, these are not my standards - they were developed by professionals who develop standards for a living. This is what other professionals are taught. And the standards are ever-changing.

No, not "slightly different"... the same. The complaint first posted addressed a lie by omission. The commercial sales people were not being totally truthful with their customers. (I believe what had transpired was more in line with having to give up frequencies once a customer moved off them and that particular band... Not that the band was being eliminated. In the first case they tried to sell the idea that because of an FCC ruling, the low band freq assignments were going away. A blatant untruth. The FCC never had planed to do that. In my case, the sales people tried to sell us on the idea there were no frequencies left within the public service band to allocate. Again, a blatant untruth. I had checked with the agency responsible for policing the assignments on the basis of things such as the 75 mile radius policy (for one) and there were available pairs. They told me I Motorola sales had not even inquired on our behalf! In both cases the commercial sales reps lied to us. They weren't being totally truthful... possibly in the first case, NONE of what they tried to shovel was the truth.

That's slightly different. Was your town told they had to move because
they were losing their current system's license?

I've never heard Low Band was being taken off Land Mobile.

BTW, that must have been a while ago because there have not been "FD
frequencies" for a couple decades when the FCC consolidated all PS
frequencies to one pool.

Another funny story (SAME county involved). We sold a VHF repeater
system to multiple communities in the densest region of the county. The
county EMA/911 people said they HATED repeaters and would never want to
use them (the PDs loved the fact they could finally talk to each other
without going through the county). Today the entire county is on a
trunked 800 MHz P25 system. Virtually all channels are repeated!

So, repeaters are OK when sold by company X, but not company Y. Or maybe
it was just a NIH syndrome (Not Invented Here - the VHF repeater was not
the county's idea, so it was a bad one).

JOE M., Agreed.

The Emergency Medical System (EMS) in this country and the world has and will continue to evolve, adapting to changing needs. It may lag by varying degrees, driven by indicators which first need to be identified and then vetted. (An example would be restrictions such as current certification requirements which may vary from state to state. But overall, the medical professions are continually working towards doing what needs to be done to address new issues. I relate it to the "Incident Command System", where localities would build to the level necessary, their medical response training, to satisfy identified shortcomings. To that end, if it required changes in certifications, it would be addressed with the legislators.

When I started in the fire service, I had the distinction of becoming the first EMT within the town's fire departments. I only mention this because signing up for EMT class was difficult. Ambulance personnel had first dibs, and then all others, provided the class was not full. But it was quickly recognized first responders from FD's usually had people on scene before the arrival of an EMT staffed ambulance. The sooner a patient was "plugged into" the "Circle of Life" process, the "Golden Hour" became the norm.

My personal recollection of this evolvement to higher standards started with what we were initially instructed; an EMT does not diagnose, doctors diagnose. Instead, EMT's recognize and treat those basic medical concerns such as breathing and bleeding. But EMT's recognized the need for a more advanced approach as time past. We were evolving. We were reading the signs and began diagnosing. We didn't call it that, and were careful not to overstep our bounds but in essence, that's what was happening. And after we were joined by a paramedic service much like the old Emergency TV Show (including the ability to communicate with the ER) that evolution/need to a higher EMT level of permitted treatment became apparent. It did nothing to change our basic understanding of what we did as EMT's but we all realized that we had become involved in a service that was going to change. And change it did... rapidly.

EMS started with the Highway Safety Act many years ago. I don't know if it was apparent (when enacted) the many transformations medical services would go through to date, but it has not changed the initial intent of the Act, which was to create a system of better care after an injury occurred.

And as important, It also had the effect of instigating legislation intent upon prevention BEFORE injury occurred, by insisting the automotive industry pay more attention to building safer automobiles. To this day, I am impressed every time I listen to the scanner reports of MVA's with rollovers... where first on the scene report all occupants are out of the car with no injuries.

Yes, "slightly different". Quoting you: "In the first case they tried to sell the idea that because of an FCC ruling, the low band freq assignments were going away. A blatant untruth. The FCC never had planed to do that. In my case, the sales people tried to sell us on the idea there were no frequencies left within the public service band to allocate."

I don't see those as the same. One case is an outright lie (the FCC is rebanding Low Band). The second was an opinion that wasn't true (there are no VHF frequencies left).

But, granted, both can be considered lies by salespeople. But, I have yet to hear that Low Band is being taken away from Public Safety, and the letter from the FCC affirmed that at the time. So that is not a lie by omission - that is a lie by making things up (lying).

If anyone has any credible info that Low Band is undergoing rebanding OR being taken off Public Safety, please reply. I have yet to see any proof.

Joe M.

5193. Was: When does a 536 croak? Now WAY OT

Yahoo group: BCD536HP
Date: 2017-10-03 06:05:15 UTC
From: Rick WA6NHC
Topic: 5072 Message: 5193

The actual start of an EMS system was the Fire Service, which was (and is in most places) still progressing. When early firefighters got hurt and without anyone available, they learned to take care of each other and hauled the injured to the hospital because there was little else available. That spawned the ambulance.

When the public learned how well that worked, they (and/or their doctors) called the FD for medical help. It grew from there and now most of the public expects a fire response for a medical aid call, so ambulance service was supplied as well as fire calls (already staffed, just add the ambulance to the firehouse; another service provided, everyone wins). These days about 89% of the total FD calls are medical; about 5-6% are fire related and the rest are 'other' (haz-mat, rescues, swift water; all specialties, plus a sprinkling of 'stuff happens'). The days of pinochle at the firehouse faded a LONG time ago (late 60's), just as most cops don't hang out at the donut shop (there's just TOO much to do every day now).

I was an EMT-1a (field and ambulance qualified in CA; later added SAED training) in the early 70's until I retired (now gleefully not qualified anymore, enjoying life and my brand new grandson).

You're correct that we simply patched, splinted and hauled in the 'meat wagon' then; but as the system expanded, we learned new skills, earned more respect from the (arrogant by training) ER staff which got us more access, learning and a broader experience base. Then medics (the dark side of the force) appeared, augmenting what EMTs could do, but not totally replacing them. To this day and EMT doesn't diagnose, but that line is rather blurry and with experience, the doctors tend to listen more than they used to. An active EMT learns a LOT over time; a wise doctor listens since the EMT is a trained observer; the patient wins.

In those early days, a medic (almost a NP) was allowed to do things in the field or ER that most nurses weren't allowed (applying drug treatments not by doctor order for one, cardio conversion is another), so the nurses became more trained to match/compete with medics until it finally evolved into the complex system that we have now. Nursing became specialized (MICN, trauma, surgical; specialties like oncology, pediatrics, geriatrics etc.); doctors (still too much arrogance) begrudgingly accepted there were others of talent and the lines got blurred.

[To say that a little more training of a medic will create a nurse is highly inaccurate. Nursing has advanced as well and is quite specialized and intensive. The pay differential varies, but neither makes a fortune at their jobs and the hours can be brutal.]

Some of that growth was sheer attitude and FD struggling to advance while the public demanded more, without increasing (tax) costs.

In my case, I wanted to learn and that was obvious to the ER staff plus I asked good questions, peered over shoulders and absorbed what I could and was not one of the drop and run EMTs (even learned the basics of reading an X-ray or similar skills). I gained access and continued to absorb, which in turn improved my field ability. I wasn't allowed to exceed my official trained skills, but I was allowed to cut corners; which later became the standard, simplifying much of the daily EMT actions (after ten years, EMT standards caught up to real life field work). Being hardheaded worked in this case; the ER staff was much the same so we coexisted. ;-)

Some of the new laws created havoc (PITA effect); which resulted in a more refined system over (a long) time and also (to bring it back on topic) why some of the scanner traffic is totally neutral for any ID of a patient (NEVER a victim, we deal in patients, the LE has victims and suspects)... with the ever expanding (then) cell system and (sorta) secure digital phones, some of the chatter went on the phone. Technology became a nice convergence point, smaller, lighter, cheaper than the monstrous and heavy boxes we had to use back then that rarely worked like on TV. The public got better more efficient service (while the budgets were still being cut).

Some of the new diseases that appeared were downright scary since nothing was known and they were clearly fatal; while the laws protecting patients made actual talking more difficult. For a while we used a catch phrase "Use CDC precautions" which to a listener was duh, but told us to make sure to use full PPE (didn't in the early days at all; masks, medical gloves etc weren't available). For another example, a suspected AIDS patient (new in the 80's) could be transported, but the field folks could not be told what they had been exposed to; that would violate the laws. Wink wink, nod nod didn't work, so BIG ears had to listen carefully and some threats were made; it wasn't very pretty. That eventually cleared up, but it's a scarier world out there now for field workers and hospital staff.

I don't miss those days (some really heart breaking calls, a fair amount of ugly, some routine with an excess of BS on a lot of it), but my most fun on calls was being able (as a line Captain) to step back and manage others; actually creating then putting a plan into action. THAT was a hoot.

Now I just listen because I'm used to having situational awareness and after a lifetime of hearing the radio or scanner, it's a comforting background noise. I still don't 'like' hospitals, that's were the highest concentration of sick people are, still a bit scary. ;-)

5197. Inquiry: Data Indication on Display

Yahoo group: BCD536HP
Date: 2017-10-10 19:00:54 UTC
From: Boyd Prestwood K5YKG
Topic: 5197 Message: 5197

In the Uniden-published Owner's Manual on page 30, there are descriptions for LNK and DAT when each appears on the display. The manual says LNK indicates data sent on the VOICE channel while the DAT indicates data sent on the CONTROL channel. What would the difference be for each datum?

On the P25 I listen to, before the voice comes up, the LNK shows, then the DAT shows, then the P25 shows during the actual voice transmission. Trunk Group ID (TGID) is always the same (711) but the User Group IDs (UID) vary.

I'm just curious as to what data is sent first on the VOICE channel (LNK) then the CONTROL channel (DAT). Is it the same information or two separate strings?

Thanks for any enlightenment.
Boyd Prestwood, K5YKG

Topic: 5197 Message: 5198

FYI, it's not "User Group IDs" (UID) - it's "User IDs" which identifies the specific radio transmitting. If it didn't change that would indicate either a forged radio on the system or someone talking to themselves.

The difference on a P25 system between LNK and DAT is not as great as previous system types where the data was almost always on the control channel only except for MDTs and the like. But the difference for P25 is simply to indicate whether it's receiving data on the control channel or the voice channel. They are different frequencies, so technically yes they are two separate things.

Joe M.

The frequency determines it.

DAT is control channel data. LNK is voice channel data.

The control channel is (nearly) always active. The voice channels are
only active when needed for voice or data communications.

High again, Joe...
If data (DAT) on the CONTROL channel is directing dispatchers and units to channels for voice comms, what kind of data (LNK), do you think, is being sent over the VOICE channels? Would it be data sent to mobile data terminals for example or would it be some kind of overflow data that would normally be sent over the CONTROL channel but the CONTROL channel was busy at that time?

I know this might be considered insignificant to some but I am super interested in exploring what this fantastic scanner can do!
Thanks again for your input.

LNK on previous systems was always things like MDTs. With P25,
it's all data anyway so it could be MDT or voice or something else.

Joe,
That answers my curiosity!
Thanks for all the help you give on this SIG. It is much appreciated.

Joe:

Thanks for your prompt reply. Understand the UID... sloppy me! OK, so the two data transmissions are different. What would you say each one represents or should I worry about this (Mountain vs. Mole Hill!)? Just being curious, that's all. Thanks again.

The control channel sends info that directs the radios to voice channels.

The voice channels (may) carry data that is used by MDTs or something
similar. For P25 systems they also carry voice data.

5208. Radio silence

Yahoo group: BCD536HP
Date: 2017-11-09 03:28:30 UTC
From: fredpiep@...
Topic: 5208 Message: 5208

I am from Paulding Ohio which is in Paulding County Ohio. We had a police action a few months ago in which the FBI and US Marshals were involved. The last thing I heard was from from our local county sheriff saying the suspect was cornered in a house. At that time the FBI and US Marshals took over and it was radio silence. I have the Uniden BCD536HP and heard nothing! I have the most recent update installed and the national database was active. Were both the FBI and Marshals encrypted? Tried to do a little research in the FCC database but was overwhelmed with info. Any help would be appreciated.

FBI/Marshals most likely are encrypted.

They are not licensed by the FCC, so that search will get you nowhere.

(and the NTIA who does "license" them has no public data available)

Most likely they were encrypted. Here they use both their own system plus the statewide system. I do hear the Marshals on occasion on their TG's on SAFET bit it's more rare now.

Joe M.,

Thanks for the NTIA “heads up”. I was about to ask who does the coordination of the entire radio portion of the spectrum? A clearing house of sorts to assure they don’t assign the same pieces of spectrum as the FCC. (Which isn’t too much of a reach when you consider the federal govt’s various and numerous departments/divisions don’t always communicate with each other.) But with your reminder of the NTIA, I went to their site and learned it’s the NTIA that handles that... in fact, because of this coordination, they have, or are going to give up a portion of the spectrum to the commercial and public safety people more commonly associated with the FCC’s assignment of frequencies. They say it will double the amount of available spectrum!

It’s quite a site and they have a blog too.

The original question about the inability to monitor the Federal Marshal’s Service and the FBI comms (I will also include the Secret Service) is, I believe a foregone conclusion... they are most probably encrypted and a waste of time, any searching by us. With the NTIA in charge of authorizing (for use) the different modes by federal agencies, and digital comms being a large part of what they have approved for use, all is most probably encrypted. I believe the use of digital comms has in part, been driven by the ease of including a reliable form of encryption. Not to mention the ability to remotely track, recover or lock out a stolen radio.

A spectrum analyzer may allow for identifying modes and frequencies, but there is no way to listen to an encrypted digital trunking system and hear intelligent comms unless we are using one of the agencies radios. (I use the term “Intelligent comms” loosely here. There are some that would argue the monitoring of an encrypted system could still be an indicator of activity, and that is intelligent, where a listener could surmise something is going on, just don’t know what!). The BCD x36HP may be able to track a particular digital mode but to what end if it’s encrypted?

Bill

I'm also in Ohio I hear the US MaArshals at least every other week. Theyy seem to have a schedule of "pickups" in my drug infested area :) They are always on MARCS, both for comms between other Marshals as well as inter agency. All in clear r(so far), though a few BIG drug busts had some enc and some not.

I run a scanner 24/7 and log any hits , it will show ENC - TG and UID so I know if they were hear. Also log and record with another.
Make sure database is up to date, make sure FEDERAL service type is ON.
I only run Favorite lists - if you use the full database - good luck.
Also often are on one of the interangeny TG's. - repeat OFTEN on one of these...

FWIW - I have all the US Marshall TG set with an alert tone, as well as any UID I have caught.
I'd also say - if your county often does ENC for other "stufff", they probably did for this.

Valid? Somewhat. There are errors in the Federal and non-Federal
listings (errors the admins refuse to correct).

Complete? Very far from it. And as the NTIA does not publish their data,
it would be impossible to claim it as complete.

Even the FCC part of RR is far from complete.

Additionally, RR's own policies allow for deletions from the listings
upon request.

While RR is a valuable source, and likely the best around on a national
scope, it's sourced by users and not by any official data source.

NTIA does maintain an available listing of spectrum use for 30Mhz to 3Ghz off this site, so you can actually use it to check the Radio Reference data, but why bother with when you can't listen to encrypted anyway.

Valid? Somewhat. There are errors in the Federal and non-Federal listings (errors the admins refuse to correct).

Complete? Very far from it. And as the NTIA does not publish their data, it would be impossible to claim it as complete.

Even the FCC part of RR is far from complete.

Additionally, RR's own policies allow for deletions from the listings upon request.

While RR is a valuable source, and likely the best around on a national scope, it's sourced by users and not by any official data source.

5220. Re: [BCD536HP] Radio silence

Yahoo group: BCD536HP
Date: 2017-11-11 23:02:51 UTC
From: N1chu
Topic: 5208 Message: 5220

It’s been my understanding the reasons for digital radio systems have been driven by a couple of factors. And while they may not be the only factors, they certainly weighed heavily upon those that were seeking new comm systems. I believe first and foremost, there were a finite number of frequencies available on VHF High & UHF public safety bands-they ran out. Additional spectrum was open up in the 800 MHz region to relieve pressure with the understanding trunking would reduce future spectrum shrinking and not suffer the same fate as the VHF/UHF bands. And although trunking doesn’t need to be digital (and 800 MHz allocations don’t need to be part of a trunked System), Digital was seen as a way to go due to the ease of including encryption. And this encryption is the second reason.

I dont profess to accurately state the historical aspects of how available spectrum space got to where we are today, or when trunking and then digital trunking came into popularity. But I have a “feel” for what it is I think we should expect down the road. The historical aspects are just me working backwards from what my “feel” for the situation shows and a reason, justification as to why I have this feeling... which is this...

I believe with more and more trunking systems coming on line, and the use of digital overtaking analogue, it stands to reason encryption will increase due to its ease of inclusion when coupled with digital trunking systems. It’s that ease of inclusion (technology) that has drastically reduced the cost (in some cases it’s thrown in for free to sweeten the deal).

So, a pat answer of “No” to questions that ask “Can we expect, or continue to expect, to monitor the spoken intelligence of radio comms of any digitally trunked agency, be it local, state, or Federal?” This negative answer will become more and more of a foregone conclusion.

I’ve always assumed there was a dotted line separating the federal govt from state and local govt where there were legitimate needs for encryption for some at the federal level and maybe a few state needs but it’s usage (need) would dwindle as it got closer to the local level. I don’t think there is any objection to encryption of sensitive matters, the military, FBI, Secret Service, etc. Which is just as well because getting them to drop encryption literally takes an act of Congress! But we CAN make a difference on the local and state levels if we just pay attention to budget proposals and get involved BEFORE they are finalized. All it takes is one person to ask “Is this new multi-million dollar comm system going to be encrypted?” The implication of a “Police State” gets voters thinking about what we are all thinking about these days, the “what if’s” of the rampant paranoia. The paranoia I refer to here is this; The Constitution states we have the right to bear arms against both foreign and domestic enemies. It’s that domestic threat I believe our Founding Fathers were concerned about... it provided the means to defend against our own govt if need be. Until our Declaration of Independence, we were ruled by the British govt. So provisions in the form of the second amendment were added to the Constitution. We didn’t like one ruling govt (the Brits) so it is protection against any govt WE create that ends up going NOT the way of “Of the People, By the People, For the People”.

If any objection to the implementing of encryption ever got to the Supreme Court the previous Constitutional issues should provide a damn good basis when pleading a case against encryption.

A small disclaimer; I do not advocate eliminating all encryption. I believe there is a need for it. (Hell, we aren't going to stop it entirely anyway). What I DO advocate is using encryption sparingly. Only encrypt the sensitive stuff.

One man's opinion,

Bill

> I believe first and foremost, there were a finite number of frequencies available on VHF High & UHF public safety bands-they ran out.

If you take any given frequency range, and factor in the various frequency separation (“channel spacing”), then yes, there are a finite number of available “channels”.

> I do not advocate eliminating all encryption. I believe there is a need for it. (Hell, we aren’t going to stop it entirely anyway). What I DO advocate is using encryption sparingly. Only encrypt the sensitive stuff.

Agreed. No problem with encrypting the “sensitive stuff”. There’s no good reason that I can think for Average Joe Citizen to want or need to listen to gang or drug details, vice details, or arson investigators. Pretty much everything else should be in the clear. Just my opinion. The routine calls which make up 99.9875% of what police officers do on a daily basis should be available to us to listen in on.

Human nature being what it is, it has been my observation that while specific police frequencies are encrypted, the actual information about what is happening is frequently repeated by other agencies (who may be monitoring the situation or have a role to play) on a non-encrypted transmission. (e.g. fire, ambulance, public works, other police agency, etc)
For example, during the Boston Marathon bombing aftermath, multiple agencies were broadcasting details that were more factual than what the live televison news crews were repeating on air and at times it was actually pretty funny how wrong the tv people were. I have no idea if I heard the FBI or not but I heard plenty of details as the story unfolded.

Sort of similar to the old situation when the police use a 10 code and you don't exactly know what it is but the ambulance gives out all the details including the guy's medical history

Do you have a more specific link? I looked but
cannot find any listings for non-FCC services.

Topic: 5208 Message: 5225

There were occurrences at the Boston Marathon Bombing where the news media were hanging around parked police cruisers, the officer, for whatever reason was out of their vehicle (traffic, crowd control, etc.) and had the PA system broadcasting the police transmissions. The officer may not have had a portable radio with them, or the battery had died, or they just wanted to listen to one of the other Tac channels. I don't know what, if anything Boston PD encrypts, but if you were a reporter lucky enough to be hanging around a cruiser that was using an outside speaker and the radio set to an encrypted channel, you were golden! And treated to encrypted info in the clear!

As for gleaning info from other unencrypted departments about encrypted departments, I can't say it's all that feasible. I have an encrypted trunked System next Town over. But only the PD is encrypted. They run an ambulance service on the same system and I will turn the EMS channels on if I hear or see a police cruiser responding lights and siren. But usually miss the location of the call because I only turn on EMS after I hear a siren. If I were to leave EMS on all the time, I miss other depts because EMS is very busy. I'm not interested in EMS house calls anyway. And yes, the FD gives info for auto accidents in need of both EMS and FD suppression/containment.

However, nothing is heard of the suspicious person, prowler, hold-up, etc. And, as I am not about to set up additional radios to listen to surrounding departments and other municipal depts in the same town, like highway, water, sewer, because it's a heck of a lot of work! Then there's the dedication needed to sit by and monitor. I believe it should be unnecessary. The majority of transmission are not sensitive. Evaluate and Encrypt those that are And leave the rest in the clear.

While you are entitled to your opinion, the issue with encryption really boils down to whether the agency thinks they need it for operational security.
In Arizona one police department had the press respond and arrive on scene to a police call of a man with a gun prior to the patrol cars getting there.
That was a problem for them and after that incident the municipality went to full time encryption for PD.

Boston PD encrypts Detective call groups on occasion.
There were other agencies / municipalities involved in the Marathon incident, not just Boston PD, including the MA State Police
The incident that provoked the massive response occurred the night before and was widespread in the Boston area.
Once I got a phone call around 5 am advising me that maybe my daily commute into Boston might be one to skip for once, I had three radios running listening to everything as I worked remotely online from my den.

My observation was that everything I heard was broadcast unencrypted and repeated several times, including when the swat teams moved in to flush Tsarnaev out of the boat and fired rounds into the boat.

The only people who didn't have the full story were the media who were too busy broadcasting to be listening as I had my television on the Boston station hearing what the police said and the reporters thought was happening.

Didn't they have laws against interfering with police ops? Didn't they charge him under those existing laws? THAT is how you stop things like that. Their reaction was one that had something to do with a baby and bathwater.

Their actions also show complete disregard for transparency and respect for the public. And people wonder why the police are disrespected more and more these days...

BTW, I bet the gun sales skyrocketed in those areas. I know they did in a local area that encrypted. When the public is shut out from monitoring their protectors, they will take their protection upon themselves. And the answer is not to deny them that reaction, but to restore transparency.

Link to DHS document attached
https://www.dhs.gov/sites/default/files/publications/20160830%20Considerations%20for%20Encryption_Final%20Draft508.pdf

On Thursday, November 16, 2017, 8:10:14 PM EST, Jim Keay <reach147@yahoo.com> wrote:

The police can't arrest the press for showing up at a crime scene. There is that thing called the first amendment.
However, the public has no absolute right to listen to police communications (at least I'm not aware of any ruling or law anywhere, but will admit to not being an expert) and when the police feel its in their interest to secure those communications, they will.
Gun sales generally under Obama (when this happened) were always very high due to the perception that at any given time a gun ban might be enacted limiting future sales.
Also right or wrong, there has been a general perception that the country has been less safe for the last eight years and police have not been able to protect individuals adequately.
As far as guns in general, in my opinion, in a best case scenario the police are five to ten minutes away, my Sigarms P229 is a much faster response if I am in danger, but then I digress.

Joe M.,

Very true, all that you write below. And it’s more of a national gun buy event, broadcast nationally by the media, spurned on for all the wrong reasons. The gun prices go up (it’s a supply and demand thing in our capitalistic society) and people pay it. They take their purchase home, stuff it in a drawer and promptly forget about the proper care and handling of a gun. But, they all believe they are responsible gun owners. There’s just one little problem... the type of “responsible” they are thinking of is the kind that deals with not pointing it a someone unless you intend to use it and treating any weapon as if it were loaded, always. Even when it’s not! The other “responsible” is the responsibility we have to our guns. We must be able to protect them, not leave them out where children can reach them. As important, not allowing others to physically take your gun away from you. I see too many yahoo’s, pistol permit in hand, and gun on their hip for all to see parading around as if they were part of some auxiliary police force. My god! (I live in Ct. Our carry permit is just that, carry any way you like. There is no differentiation between open carry or conceal carry.)

There is one question I’d like to get answered however... If we go back to before WWII for example, were the media reporting nationally when some whacknut lost it and went out and killed people?

BTW, I bet the gun sales skyrocketed in those areas. I know they did in
a local area that encrypted. When the public is shut out from monitoring
their protectors, they will take their protection upon themselves. And
the answer is not to deny them that reaction, but to restore transparency.

Yes - I know that side. The reason is a one in a million case.
That's why you have channels dedicated to those cases that can be
encrypted. Everyday routine communications do not fall into terrorist
events. Again: Baby. Bathwater.

You will note in that doc "Public Information may be accessed
through Public Information Officer (PIO) websites, social media feeds,
or directly to the media. There are a number of legal issues regarding
public access to public safety communications (non-broadcast) that need
to be examined."

Note that any sources they cite have already been "scrubbed" for what is
released. And you trust the MEDIA to not spin things? What world are you
living in? They are the least trusted source of information. we already
have seen first hand that even national outlets are biased.

The argument for encryption typically cites oversight committees. Those
only come into play IF you know there is something to oversee. Are we
the public supposed to file FIA docs for everything they do? We see that
even congress has trouble getting docs - what chance to we have?

I can use the same logic to justify encryption of FRS. I might say
something that can be used against me or someone else or put them/us in
harm's way. What right does anyone else have to monitor my FRS
communications? (an extreme example, but I used to to show that this
argument that applies to one can be used to apply to all)

There are times encryption is necessary. Nobody debates this. But that
time is not "everytime/everyday". They are denying the public vital
information needed to keep themselves safe while at the same time
compromising officer safety on many levels. That is likely part of the
"legal issues" they mention.

An excellent point that examines the issue one step farther.

It also increases the odds a gun will be stolen (and
subsequently used in the commission of another crime).

I forgot to address your other comments.

The police CAN arrest and charge someone for interfering with the performance of their duties. It's called obstruction. Injecting yourself at a crime scene can taint evidence and put yourself and others in harm's way.

Your first point is a very common misconception of the First Amendment.

The First Amendment gives the press the right to PRINT what they discover, NOT the right to do whatever they want at the scene of an emergency. They have no access rights. This comes directly from training on how to deal with the press at such scenes. We are made very much aware of what rights people have, and how to *not* infringe on those rights.

As for the right to monitor, there is no specific printed right, but citizens have the right to "monitor" their government's activities and be aware of dangers in their environment. In fact, ironically, that is the basis for why we have guns - to protect against runaway government. That would be the Second Amendment, of course. Every day we come closer to justifying it. So, the only way to protect against runaway government is to know what they are doing.

The point isn't that the police can arrest someone for obstruction of justice, the point is that when the press shows up at a crime scene, that act does not constitute the crime.of obstruction of justice.

Do you understand the difference?
The police can arrest someone for any number of reasons, the question always is what comes of it afterwards and what happens if its viewed as an unlawful arrest
e.g. Nurse arrested in Utah? for not drawing blood under officers orders, wasn't that obstruction of justice too? How did that turn out for the cop?
Good night all,,,

Struck a nerve, did I?

I will repost YOUR premise of the scene...

"In Arizona one police department had the press respond and arrive on scene to a police call of a man with a gun prior to the patrol cars getting there."

So, if someone has a gun, and is threatening the public, that is a crime scene. If someone puts themselves in the line of fire, they are in the crime scene, and if they had no reason for being there and were just responding to get a story, they added to the scenario which puts themselves and the public at risk (and also opens them up to civil lawsuits from anyone harmed as a result of their actions). In my state at least, that is obstruction and is a crime you can be charged with even if you're a member of the press. Again, the First Amendment is freedom to print, not freedom to enter the scene. Maybe that is what struck the nerve? That I disarmed your First Amendment point?

Now, maybe I read too much into the original premise, but it was implied that they were in an area that interfered with the PD. If that was not the case, they are not guilty, but then there is no reason for bringing that up in the first place, as they were not a factor which would be a requisite for encryption. Either they were a hindrance or they were not. Which is it?

If I am to understand you, a correction of my post is what you are after. Where the media might have or could have possibly taken advantage of reporting “accurately” because of an ability to listen to encrypted transmissions, courtesy of a cruiser’s PA System is not correct. It may not be... truthfully, I am not about to disagree with your take on it. The media may very well have screwed it up, with or without the advantage of greening encrypted info. However...

My post was in response to another post. In that post it was their observation, in which some practicality was attached to listening to many other systems, both within the town or city and outside. All in an effort to ascertain what was being discussed on the encrypted system. The Boston police car PA was something I added because I thought it worthy as a footnote? But I mentioned it only to bring attention to situations such as those rare occurrences where you may get to hear encrypted comms. Thats as far as I intended it to go, as it was not germane to the subject at hand.

Sheer uninformed nonsense and totally off topic.
Especially in this state, where gun ownership requires licensing and usually completion of an NRA safety course. Additionally, many states (including this one) require secure firearm storage and every new gun comes with a trigger lock.

I live two miles from an outdoor range available during daylight hours (that I belong to) and people are busy shooting all the time.
Membership is up in most gun clubs and the indoor range at mine is always busy and its available 24x7 with a pass key.

Ammunition sales are up because people have more guns and are shooting more.

No. I was responding to the cited scenario in Arizona which "showed" a need for encryption. I guess it has yet to be determined whether or not the alleged offenders actually interfered or not. The existence of the original reply implies they did but subsequent posts imply they did not.

We may or may not see the answer to that question, but my point pivots on that answer. As I said before, if they interfered, they were guilty of obstruction and should have been charged. If they didn't interfere, then there was no case for encryption of what they monitored.

In either case, there is no basis for requiring encryption. Just enforce the existing laws and the whole issue "goes away". The press will stop interfering knowing they may be arrested (if they were interfering). And if they didn't interfere, why use that as a reason to encrypt? Point being you can deal with either case without encryption and the problem goes away. Bathwater and baby saved.

“However, the public has no absolute right to listen to police communications”.

True and false. If the police want to encrypt, they can try. Mostly, they will be successful. But even though it’s true, the police also have no absolute right to expect it. While the general public has no ABSOLUTE right, they DO have the right to challenge. It’s this challenge I have been advocating from the get go. And the sooner a challenge is registered, the better chance the public has of limiting or eliminating encryption. At the first sign of an attempt to encrypt, the public should question it within the boundaries of their local government. With me, it’s more a question of holding the authorities feet to the fire. When I hear We are going to initiate encryption “just because we can”, I get a bit irate. Of course I know it’s not true that they have the right “just because they can”. But the large majority of the public DO believe this. Mostly, people believe the authorities are well within the boundaries of law and have every right to do as they please... and god forbid those that choose to challenge out of fear of retribution. Paranoia runs rampant.

I like to think I am a realist and as such do recognize there are times encryption is totally justified. Sometimes sensitive info need to be disseminated in a timely fashion. But there should be a meeting somewhere in the middle where it’s understood we, as a responsible public recognize the need for partial encryption and the police recognize total encryption will eventually cause the public to harbor thoughts of a “police state”, causing the paranoia I speak of.

My local PD do not think there is a need for encryption at present. But that’s only because they already have “secure” avenues of communications available to them through the use of mobile data terminals (MDT’s), cell phones, and a pool of additional channels made available, provided by state and federal agencies. (I honestly think they never really thought it through however, because once they leave their cruisers and rely on their portable radios, the range diminishes and their availability of accessing “pool” frequencies is affected by the limits of their equipment.

So, I take issue with what the term “absolute” means as used in the context of this thread. It should not apply to either side of the encryption issue.

One man’s opinion,

Bill

The case for encryption is documented in the DHS document and it doesn't matter what you or I think about it, the LEO perspective is spelled out perfectly in that document and if you don't want to accept my post on the circumstances in Arizona, the DHS document provides you with another factual source concerning problems there and elsewhere.
To repeat my original point on that, the police will encrypt when they think their operational security requires it and that decision will be made by them, not you or I.
And yes, I still feel that information gets repeated by other agencies when they respond and is available if you listen to them as well. e.g. Fire Department broadcasts in the clear, they seldom worry about anyone listening to them. In addition to less focus on security, there may be technical issues. You can choose to believe it or not, doesn't matter to me, but it is my observation.
So if the police think they gain more operational advantage from non-encrypting via inter-agency cooperation or general transparency, then perhaps that path is one they will choose.

Here is an article of interest on that
Now hear this: Emergency agencies turn off radio encryption

Concerns About Radio Encryption

On Friday, November 17, 2017, 3:07:09 AM EST, MCH mch@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

No. I was responding to the cited scenario in Arizona which "showed" a need for encryption. I guess it has yet to be determined whether or not the alleged offenders actually interfered or not. The existence of the

original reply implies they did but subsequent posts imply they did not.

We may or may not see the answer to that question, but my point pivots on that answer. As I said before, if they interfered, they were guilty of obstruction and should have been charged. If they didn't interfere, then there was no case for encryption of what they monitored.

In either case, there is no basis for requiring encryption. Just enforce the existing laws and the whole issue "goes away". The press will stop interfering knowing they may be arrested (if they were interfering). And if they didn't interfere, why use that as a reason to encrypt? Point being you can deal with either case without encryption and the problem goes away. Bathwater and baby saved.

You write;

“To repeat my original point on that, the police will encrypt when they think their operational security requires it and that decision will be made by them, not you or I.”

“Not you or I?” Seriously? You are treading on the rights of every US Citizen... and, in the process, advocating a police state to boot. Nobody has given law enforcement ABSOLUTE authority to do anything. And this country was built on the premise no one ever will. Absolute is a word YOU chose, not me. In the case of encryption, to do so would be in direct violation of the Constitution and the Bill of Rights. The Congress can make as many allowances as they please. And the US Supreme Court will null and void them as unconstitutional when challenged.

Lest we forget, it goes something like this... “Of the People, For the People, By the People. We run this country. We appoint those that create the laws. They work for us. And this is the only thing that’s “Absolute”. And continues to be absolute as long as we defend that Constitution and Bill of Rights.

Your refusal to accept differing points of view label yourself as radical. It’s apparent you are not willing or able to discuss this topic rationally. So, pardon me if I see it’s time to stop wasting my time on you. I am done. You may have the right of last word on the matter... I really don’t care. There will be no reply by me.

To my knowledge, there is no absolute right to listen to radio communications (lets limit discussion to US Constitution or any State constitution that I am aware of) and while you may hold an opinion on it otherwise, the facts don't seem to support it, although I would be glad to be proven wrong. And frankly, I agree with your position for the most part.

The government controls the spectrum allocation and licensing, so their authority is pretty established.

Also, I believe there are laws that make it illegal to listen to encrypted radio traffic, regardless of the technical feasibility and yes I agree with you faster computers make it theoretically possible, its still prohibited.
Which brings me back to my other point, its easier to just listen to another agency.

On Friday, November 17, 2017, 2:29:24 PM EST, N1chu n1chu@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

“However, the public has no absolute right to listen to police communications”.

True and false. If the police want to encrypt, they can try. Mostly, they will be successful. But even though it’s true, the police also have no absolute right to expect it. While the general public has no ABSOLUTE right, they DO have the right to challenge. It’s this challenge I have been advocating from the get go. And the sooner a challenge is registered, the better chance the public has of limiting or eliminating encryption. At the

first sign of an attempt to encrypt, the public should question it within the boundaries of their local government. With me, it’s more a question of holding the authorities feet to the fire. When I hear We are going to initiate encryption “just because we can”, I get a bit irate. Of course I know it’s not true that they have the right “just because they can”. But the large majority of the public DO believe this. Mostly, people believe the authorities are well within the boundaries of law and have every right to do as they please... and god forbid those that choose to challenge out of fear of retribution. Paranoia runs rampant.

I like to think I am a realist and as such do recognize there are times encryption is totally justified. Sometimes sensitive info need to be disseminated in a timely fashion. But there should be a meeting somewhere in the middle where it’s understood we, as a responsible public recognize the need for partial encryption and the police recognize total encryption will eventually cause the public to harbor thoughts of a “police state”, causing the paranoia I speak of.

My local PD do not think there is a need for encryption at present. But that’s only because they already have “secure” avenues of communications available to them through the use of mobile data terminals (MDT’s), cell phones, and a pool of additional channels made available, provided by state and federal agencies. (I honestly think they never really thought it through however, because once they leave their cruisers and rely on their portable radios, the range diminishes and their availability of accessing “pool” frequencies is affected by the limits of their equipment.

So, I take issue with what the term “absolute” means as used in the context of this thread. It should not apply to either side of the encryption issue.

One man’s opinion,

Bill

You don't have a right to drive a car, own property, receive broadcast TV/Radio, or even breathe air. But there are expressed written rights and there are inferred or implied rights. In order to carry out certain constitutional rights it is necessary to know what your government is doing. Hence, any action to hide what they are doing is an indirect violation of that right.

Even the doc you posted the link to makes reference to the legal issues.

Just look at the recent actions that are viewed as correcting violations of the rights of citizens (or as a result of implied rights). Statues are being dismantled. Names of schools are being changed. These actions are not the result of any expressed written rights, but are a result of inferred rights. (and mostly historical revisions and historical cleansing)

That said, let's move on. You obviously have your own opinions that will not be changed by a discussion.

Oh, and true it is unlawful to monitor encrypted communications unless you're a party authorized. It is also unlawful to monitor Cellular, Broadcast Auxiliary, cordless telephone, digital paging, and several other types of communications. (And even certain Public Safety communications in some states/areas)

5244. Problem with Frequency

Yahoo group: BCD536HP
Date: 2017-11-19 05:46:32 UTC
From: TLFerg53
Topic: 5244 Message: 5244

I’m having a problem with getting a FD about twenty miles away to come in clearly, yet, the Sheriff’s Office, when transmitting on the same frequency, comes in fine when relaying information to the responding units and wonder if I may need to program the BCD536 using both the frequencie seven though their the same ? We did also recently replaced the outdoor antenna with a diamond antenna D3000N L as recommended here.

The frequencies in question are for Illinois-Jefferson County-Jefferson Fire Protection District (154.430) and the Jefferson County Sheriff’s Office fire frequency, also 154.430.

JFPD comes in as though it was 70 miles away while the SO comes in as if I was right next door.

Thank you,

Tim

Frequency doesn't matter - what matters is where their repeater is. Sounds like one repeater may be further away from you.

Location, yes, AND how much power they’re putting out. The further repeater may be putting out 100 watts and closer repeater 35 watts, and the further one may sound better, as if it were closer.

Even if the power is not the issue, the terrain between you and the transmit antenna may be the difference. Terrain being a generic term for actual terrain or trees, buildings, hills/dirt, or anything else in the path.

Also many times antennas are selected to provide saturated coverage in the service area, so the same amount of RF power could be directed at the horizon or down into the service area.

There are many factors that could be in play. Distance in it's pure form is usually not a factor - satellites use low power very far away. Terrestrial communications "distance" is usually more a factor of curvature of the earth or one of the factors in the first paragraph.

As mentioned, it also could be power. I don't want to make it sound like I'm dismissing that possibility.

“Distorted” implies you can make out at least some ofwhats being said. If this is the case, then no... it’s probably not encrypted. There are audio examples of what encryption sounds like out there on the web-you can do a search for them. Encryption leaves nothing at all to be deciphered, other than the fact a transmission has occurred. A hiss is usually what is heard. Voice inversion was used some time ago and may still be but you could better compare that to distortion as it contained voice qualities.

Without knowing more, it could be that one agency’s transmitter puts out a higher-power signal than the other. The don’t all use the same radios, etc. I’m not sure where, exactly, you are, but Illinois is fairly flat so it can’t be that there are hills or mountains in between you and the JFPD.

I think it’s safe to say that most all of us experience the same sort of thing. Why do we here THIS one so good and THAT one comes in like crap, and there’s no logical reason for it.

No repeater involved from the FD base to the best of my knowledge, which, it itself, may be the issue with the SO working from a higher power base via a repeater.

Does adding the PL make any difference? I didn’t think so and didn’t add it.

Tim

Modern day P25 encryption would be using what is called Type 3 AES encryption. You would not be able to copy any intelligent audio encrypted in this fashion. It uses a 256 bit key. This is sometimes also called Suite B encryption. Motorola radios can also use what is called ADP encryption but it is a proprietary system and not compatible with other radio manufactures. For interagency interoperability AES is pretty much the standard today. There are a number of good articles on the web related to Type 3 AES.

I have also found that the BCD536HP is very much prone to digital decode error of P25 with strong signals which makes audio sound distorted. If you use an external antenna this is common. I solved this by just adding attenuation to trucked systems. If you analyze these systems with the scanner you can look at the bit error rate. The higher the bit error rate the more the signal will sound distorted. The scanner has an auto function for this but I have found that adding attenuation worked further to improve digital decode quality.

Are you in their service area? (if not, how far from it?)

If it's simulcast, you may be picking up two (or more)
towers that are mutually interfering with each other.

This may be resolved if the system is new
depending on the skill of the techs working on it.

If it persists, a direction antenna to
null all but one site may be required.

Thanks Joe M.

Yes it is the NEW Mobile County P25 Digital System. I agree with you. I believe it is the techs that are working on it.

Because before, a couple of months back when they were testing I could hear them really great!

They were using thing like, The little brown dog went down the hill.

Then the person on the other end would say like, The bluebird flew south. On and on, then it has been dead until last week.

Ok following up on an older thread..

Friend is modifying the 536 for discriminator tap. He's asking if the tap should be soldered to the l or the right pin of the jack he's adding for the discriminator output? Or both?

Thanks :)

One pin goes to the tap and the other goes to
ground. Which is which depends on his wiring.

Have you asked the FD the same question? (The FD is a better bet than the Sheriff... law enforcement tends to be a bit tight lipped) There are probably others who had the same question within the FD and have an understanding of it that they would be happy to convey to you.

It’s been my experience your question could be answered by the in-house staff. Or, if they don’t know, they probably know who does.

Let us know if you do decide to ask and what the answer was.

5266. Re: [BCD536HP] Problem with Frequency

Yahoo group: BCD536HP
Date: 2017-11-24 03:07:26 UTC
From: Tim Ferguson
Topic: 5244 Message: 5266

I appreciate all the assistance and information, but, after checking each location’s license information, I discovered that the SO antenna is up 150 ft. on top of the county courthouse. The FD’s license shows an antenna up on a 30 ft. tower next to the building..... :-).

On to the next issue....

Tim

Is there a way to put it in your vehicle and drive closer to the transmitter and see what happens ?
Intermod at your location ?

5270. Programming Cheat Sheet

Yahoo group: BCD536HP
Date: 2017-12-07 01:22:56 UTC
From: cline_les@...
Topic: 5270 Message: 5270

I just purchased a BCD536HP and having a terrible time trying to get it programmed. I entered my zip code and that seemed to get me started but I hear very little activity in my county. We recently had a fire in an vacant house about 1/2 mile from my house and was not able to hear anything on the scanner. We had the fire department, ems, and sheriff department respond but nothing was heard on the scanner. I have looked at several YouTube videos but still having problems. Does anyone have a cheat sheet or a one line drawing showing some information that they wouldn't mind posting. I would really appreciate it.

Les

Where are you located?

Also did you enable all the Service Types on the scanner.
Stock I think it only has the dispatch channels enabled.

Oh bosh. Entering the zip code is enough *IF* the service types are also correctly selected. Usually it’s WAY too much to hear.

You’ll want to update the full database, which gives you a starting place to learn Sentinel, the programming utility.

However, note that some channels may be listed to other services such as Federal; including many TAC channels.

Researching RadioReference.com for your area would be very useful to learn what your area uses. Then add State and Federal departments (within the things you want to hear, like fire).

In time your list will grow too large, you’ll figure it out and you’ll cut it down to match your needs. It’s a process.

The database is updated weekly so if you depend on it for your programming (some areas are stagnant, some are highly dynamic) you’ll want to update often.

I do that because I’m often traveling, using the GPS and full database for programming as I move (LOVE that feature!).

Welcome to the group.

Actually it may "not" be enough. Especially if there is a new system being built out. In that case the database my not be in the update yet.
Hence needing to know exactly where the OP is helps. Also if the new system is capable of being monitored would be known by other users in that area.
So there is more to know than just services and zip code.

Right, like I said, update the database. Problem solved, for a new user. As he learns more, he can adapt it to his needs. If there is a new system, it's not the place to learn a new scanner until accurate data is in place. If it's accurate in the updated database, he's golden.

Also use RadioReference.com for review since it gives the exact same data in a more user useful manner (it's cross linked and has visuals).

Radioreference is a good resource but keep in mind that it is not always accurate and up to date. it’s very much like Wikipedia, also not known for it’s consistent accuracy. I know of several listenings on Radioreference that are not just innacurate but no longer existing in terms of users and their frequencies.

Right, like I said, update the database. Problem solved, for a new user. As he learns more, he can adapt it to his needs. If there is a new system, it's not the place to learn a new scanner until accurate data is in place. If it's accurate in the updated database, he's golden.

Also use RadioReference.com for review since it gives the exact same data in a more user useful manner (it's cross linked and has visuals).

Oh bosh. Entering the zip code is enough *IF* the service types are also correctly selected. Usually it’s WAY too much to hear.
You’ll want to update the full database, which gives you a starting place to learn Sentinel, the programming utility.

However, note that some channels may be listed to other services such as Federal; including many TAC channels.
Researching RadioReference.com for your area would be very useful to learn what your area uses. Then add State and Federal departments (within the things you want to hear, like fire).
In time your list will grow too large, you’ll figure it out and you’ll cut it down to match your needs. It’s a process.
The database is updated weekly so if you depend on it for your programming (some areas are stagnant, some are highly dynamic) you’ll want to update often.
I do that because I’m often traveling, using the GPS and full database for programming as I move (LOVE that feature!).
Welcome to the group.

Can you explain what P25E is?

If E means Encrypted the answer is no.

If you meant P25, the answer is yes (again, provided it's not encrypted)

It's all VHF high analog. You probably just need to update the database wit
Sentinel and enable the correct service types.

It looks like you would need the following Service Types enabled:

Fire Dispatch
Fire-Tac
Fire-Talk
EMS Dispatch
EMS-Tac
EMS-Talk
Law Dispatch
Law Tac
Law Talk
Multi-Tac

Gil, if by P25E you mean Project 25 Encrypted, then no. The frequency may not have changed but it’s not the frequency you should be concerned with. It’s that “E” on the end of your P25. If this E means encrypted/scrambled, no scanner will be able to hear what’s being said. Encryption is a deliberate or intended move by the people who use that radio comm system to prevent unauthorized listeners from hearing and understanding the transmissions.

In an effort to verify if encryption is being used, tell us the town, county, state and entity or service (FD, PD, etc.) that uses the frequency.

The database is updated weekly.

If you’re in a radio dense location, they tend to be dynamic and updates should be applied often.

By checking RadioReference.com you can see updates or changes on their visual aid (map).

That will guide you to how often you need to update.

On my last trip there, in early 2016, there was no encryption in use.
There is some Phase 2, but Radio Reference does not show any encryption
by either Carrol County or Westminster.

The Phase 2 is currently not by any public safety agencies.

You would have to change Audio Type to "Digital" or "All". If you choose "Digital", it would be helpful to enter the NAC or do a search for the NAC.

Other than that, there is nothing you need to do.

Audio type changes won’t help hear an encrypted signal. Gil refers to a P25E System. I believe the “E” stands for encryption.

On Dec 15, 2017, at 10:34 AM, Gary Saffer ghs159@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

You would have to change Audio Type to "Digital" or "All". If you choose "Digital", it would be helpful to enter the NAC or do a search for the NAC.

Other than that, there is nothing you need to do.

The “E” after P25 designates “Encrypted”. I’ve never seen the E refer to any other designation. And of course, if the channel or system is encrypted/scrambled, the intent is for only authorized radios to be able to decipher the audio. A scanner that is programmed to receive an encrypted channel or system would only be able to hear when a transmission is made but not the conversation. There may be a hissing sound heard but no understandable conversation.

There are variations to what unintelligible noises might be heard from an encrypted system, but the bottom line is a scanner that gets programmed to listen to encryption is only wasting your time. Stopping on encrypted channels/systems and waiting for the transmission to complete just slows the scan rate down. Unless the encrypted system is monitored only to discover increases in transmissions (ex: when it gets busy it might be indicative of something juicy going down). This could alert you to a need to pay attention to other services that might have also been dispatched and are NOT encrypted. I often hang out one town over from where I live that has a trunked System where the PD is encrypted but the ambulance and FD are not. When I hear the police responding I will perk up and start listening more closely to the ambulance and FD traffic, as a good portion of the PD calls are usually for fire and medical calls. And sure enough, a minute or two later, here comes the fire truck and/or ambulance! The ambulance and FD talk-groups are in the clear so I get the location and what the call relates to. This allows me to discriminate, the remaining PD responses that have no associated Ambulance or FD dispatches are most probably related to the criminal aspects of the service (bar fights, holdups, etc.) I differentiate between calls by categorizing them into just two groups... one where the PD is needed because they are equipped and have the authority to use force against others to neutralize dangerous elements, and secondly, their ability to assist, make a difference, at accident scenes, medical calls, etc.

Ok, I got off topic a bit. But maybe somebody got some enjoyment out it.

Bill

P25 is a transmission mode, much as FM and AM are transmission modes. The frequency would remain the same. Nothing to modify. What is P25E?

Where is the "E" designation coming from? If that was posted, I missed
it. The only way to know for sure is to listen. If it's encrypted it
will be readily apparent and the channel will be unmonitorable.

I saw that, but not Gil's source for that. Without knowing where he got
the information, there's no way to know what that designation means.

It's not used that way on Radio Reference or other websites with which I
am familiar.

Maybe if he tells us what system, we can make a better judgement on what
that means.

P25E is most certainly used on radio reference. Look at FEMA for example.

https://www.radioreference.com/apps/db/?aid=7770

And he did mention earlier in the thread he did mention what agency, and they are P25E.

...and it’s good to see the Radio Reference listing for Stratford, Ct., has been updated also. The PD is shown as using a P25E comm System. Also known as Project 25 or APCO P25. The “E” was tagged onto it to designate the fact that they encrypted which is sad. I guess there wasn't enough public interest in raising a concern.

On this system https://www.radioreference.com/apps/db/?sid=374

Mobile County Alabama System Type EDACS / System Voice ProVoice

The City & All Police Radios in all the Municipalities have gone silent.

The only thing that is left is The City & County Fire & EMS..

On this system https://www.radioreference.com/apps/db/?sid=9284

System Project Phase II, System Voice APCO-25 Common Air Interface Exclusive

I can receive all kinds of ID's but the voice is distorted. Garbled!

I have more ID's (about 400 more than what is list on RR

For The P25 Digital System and it shows only one ID Encrypted .

Again, all I can hear is distorted and Garbled!!!

I have also been told that if it is Encrypted you would hear nothing but you would see the talk ID #...

What am I missing here, Please help if you can and are willing???

My antenna is an outside mounted on a 50' pole and is pointed at the correct tower and is less thyan4 miles away.

I am using ARC BUTEL software for programming on BOTH the BCD536 base and the BCD996P2 Base.

Is there something within the software or scanner I need to tick / check or setup so I can hear these ID's.

Thank You for Any and All help!!!

Thomas

If that is what’s happening, overloading the receiver, turn on the attenuator. This is assuming you are receiving two separated sites transmitting the same signal at the same time? I see a lot of comments about the problem of multiple sites being simultaneously received, all transmitting the same and mixing. But since I have never experienced it myself, I never bothered to research it. So, I’d like to know what results you get with a lessor antenna as suggested by John.

5314. Butler County Ohio

Yahoo group: BCD536HP
Date: 2017-12-26 21:55:02 UTC
From: Kevin Tribbe
Topic: 5314 Message: 5314

Using my 536 I have the Butler County MARCS P25 channels programmed into a favorite. Reception seems to be great during the day but at other times (especially at night) the reception drops off. Other local counties on different towers seem to work fine. I have a Tram 1410 Broad Band Discone/Scanner Base Antenna
In the attic. Where do I start to trouble shoot this?

5315. RE: [BCD536HP] Help On System

From: johnstark@...
Topic: 5308 Message: 5315

Try a stubby antenna.

If it were encrypted you wouldn't hear anything. Garbled transmission is usually a reception issue. Also try changing the p25 wait time and other settings which you can find in the manual.

John

I for one am still absorbing input on the issue. It might be simulcast interference or it might be encryption. The former is solve-able. The latter is not (without lawsuits and prayers which will make one wish for $1400 bills).

The fact the lesser antenna made no change leads me to believe it might be encryption. That's an easy problem to "solve" - it's illegal to make the scanner decode it period.

Worst case is that the scanners hold their value well. But it doesn't help paying $150 over street price for each of them since nobody will pay more for a used one (even like new) vs a brand new one.

Joe M,

With the Upgrades on both DMR & ProVoice, 4 total upgrades @ $75.00 ea. = $300.00

Plus ea. scanner @ $560.00 that puts them costing me about $710.10 ea.…

And they were bought from one of the places that are mentioned in the different E-Mails in this group.

Thanks’

Thomas

Subject: Re: [BCD536HP] Help On System

If that is what's happening, overloading the receiver, turn on the attenuator. This is assuming you are receiving two separated sites transmitting the same signal at the same time? I see a lot of comments about the problem of multiple sites being simultaneously received, all transmitting the same and mixing. But since I have never experienced it myself, I never bothered to research it. So, I'd like to know what results you get with a lessor antenna as suggested by John.

Thanks Joe. I was hoping you were following the thread. Encryption use is easy to determine on your own if you know where to go. With me, it’s a case of finding someone who has been listening to the scanner routinely in the same area I am interested in. Before I go on vacation I like to ask the local scanner groups at my vacation destination for guidance. If that doesn’t get any results usually a visit to the local FD will do. And it will get that encryption question answered. One doesn’t need to go far before they run into someone who has a scanner in a Fire Dept... especially if it’s a volunteer house. So, if you strike out at a paid house, visit the closest volunteer house. That could be as close as the next town or if the system serves a combination paid/vol FD, in the same town!

It’s good advice for those who question the use of encryption. It would be nice if the local detective work was conducted first because if you don’t live close to the question at hand Your are at a disadvantage when trying to help.

I for one am still absorbing input on the issue. It might be simulcast
interference or it might be encryption. The former is solve-able. The
latter is not (without lawsuits and prayers which will make one wish for
$1400 bills).

The fact the lesser antenna made no change leads me to believe it might
be encryption. That's an easy problem to "solve" - it's illegal to make
the scanner decode it period.

Worst case is that the scanners hold their value well. But it doesn't
help paying $150 over street price for each of them since nobody will
pay more for a used one (even like new) vs a brand new one.

There are samples of encrypted audio you can listen to on the web. Maybe you can determine if this garbled audio you hear is a form of encryption.

Notice I stated “audio you can hear”. Sometimes encryption needs to be better described. Stating “If it were encrypted, you wouldn’t hear anything” is not necessarily a correct statement. Garbled audio could be a form of encryption. I’ve heard a hissing that is encryption. So it should be differentiated or restated as not able to hear anything intelegble.

See if you can find out more about the system you feel is weaker at night. The radio tech that is familiar with the system is your best bet. Ask if anything changes at night. It may be that there is a reduction in power or a site change for dispatch.

Using my 536 I have the Butler County MARCS P25 channels programmed into a favorite. Reception seems to be great during the day but at other times (especially at night) the reception drops off. Other local counties on different towers seem to work fine. I have a Tram 1410 Broad Band Discone/Scanner Base Antenna
In the attic. Where do I start to trouble shoot this?

Thomas,

You indicate that you have '400 more ID's than what is in RadioReference'. Am I correct in thinking you are mentioning talkgroups, not radio ID's? And the list came from a contact that would have that system information?

If you are indeed referring to talkgroups that are not in RadioReference, are most of them for law enforcement? The few talkgroups showing on the RadioReference database page are for Fire & Mutual aid, which are not encrypted nearly as often as law enforcement. If those ID's that you are hearing as garbled are listed as law enforcement, then it is likely that they are encrypted and also are being used in Phase II mode, which would be a letter T in the mode column if they were in the database. As someone else noted, while the scanner will ignore encrypted P25 Phase I talkgroups (noted with a D in the Mode column), it does not ignore those that are using TDMA, the Phase II. For them, you would hear garbled voice, I did see one comment in a thread http://forums.radioreference.com/alabama-radio-discussion-forum/353590-mobile-county-city.html#post2781556 on RadioReference that Mobile would be encrypted when they switched from EDACS to the P25 system.

HEIGTX,

You are correct that they are TALKGROUP ID’SS, not Radio ID’s. I have some of those as well.

You are correct that they are not listed in RRDB. I do not know which ID goes with what municipality.

On RRDB the ones they do list are all (D) just digital except 1 and that 1 is EMS Supervisor (DE) Digital encrypted.

Even the ones on RRDV that says they are just (D) digital or in fact (DE) digital encrypted because they too are garbled and cannot be understood.

I do not know who put those into the RRDB but they are WRONG. The only ones I have found to be in the open are The Alabama State Docks Security!

And I am talking about the NEW P25 Digital System in Mobile County Alabama.

Link:

https://www.radioreference.com/apps/db/?sid=9284

If you look under the MODE they are all just (D) digital and 1 is (DE) Digital Encrypted.

But again they are all Encrypted.

Thanks’

Thomas

Yup. It’s encrypted. So now you should (If you haven’t learned already) find out how much of that system is encrypted. A lot of times they leave the FD in the clear. Hopefully, that is the case here. For the kind of money you shelled out I’d be making it point to learn who is the local resident scanner guru and seek him out. That person can tell you more in ten minutes than we can in a month!

Sincerely wishing you the best,

Bill

Start with things like what is around you and between you and the site you listen to. Weather can affect reception as can trees and structures. It's possible for them to rotate the CC as well and it's possible they rotate am and pm and that the pm antenna is on the opposite side of the tower from your location causing a change in reception. It's not common but I have witnessed this ONCE with one system someone was having trouble with.

On my 436s and 536 encrypted comes through as garbled sounds like a bunch of people in a street fight. You may want to check Radio Reference and see if they’re encrypted. Also if those talk groups are available on Broadcastify or one of the cellphone scanner apps you can compare.

Yes. The Sentinel software will program the 436 and 536. Simply write to the scanner.

The x36 won't handle encryption. No current scanner will (that I'm aware of).

I was wondering about that, too, and came to the same conclusion.

The DMR/PV keys are unique to each scanner,
so multiple scanners will need multiple keys.

Rick,

Just a warning to anyone that uses RadioReference to see if a Digital system is ENCRYPTED or NOT!!!

I went by what was on RRDB and it showed all to be just (D) digital UNENCRYPTED except for 1 (DE) Digital ENCRYPTED!

I am out of over $1,400.00 and does not include the pre-programming on each 536 for 2 Counties on each.

Now they are just expensive door stops!!!

Thomas

There is nothing in your area that is not encrypted?

(which I know cannot be true)

As for RadioReference, it's likely the best nationwide source, but is not 100% accurate (some would say far less). That has been discussed many times.

Still, it is clear there was a lack of research prior to purchase. Further, you should be able to sell them for nearly what you paid since they hold their value well, so it's not like you are out over $1400 in any case. (again, provided there is nothing else you want to listen to)

Rick,
Just a warning to anyone that uses RadioReference to see if a Digital system is ENCRYPTED or NOT!!!

I went by what was on RRDB and it showed all to be just (D) digital UNENCRYPTED except for 1 (DE) Digital ENCRYPTED!
I am out of over $1,400.00 and does not include the pre-programming on each 536 for 2 Counties on each.

Now they are just expensive door stops!!!

Thomas

Thomas,

Two points on your gripe session about loosing over $1400...

First and foremost, it is common knowledge that RR gets its data from regular people like you and I who volunteer input of known systems. There may be some vetting of this input but again, it’s never a guarantee that the data will be all and everything. And RR isn’t shy about making people aware of this. It’s on you to vet the data before spending your hard earned money. RR is not at fault for the unfortunate situation you find yourself in.

Secondly, you are NOT the proud owner of a couple of boat anchors costing $1400. You obviously had your heart set on monitoring the encrypted system but it’s time to repurpose the scanners... get your heart set on monitoring something else, or sell them outright and take a loss. But it certainly won’t be a $1400 loss!

Beating yourself up over this is not the answer. All are sorry it happened but had we known beforehand we might have helped you decide what your choices were or if you had any to begin with.
Another hard lesson in life. You are not alone. You’ve just joined the biggest club in the world!

Good luck going forward,

Bill

Ok... now be part of the solution and submit them... Or be part of the problem and don't.
RR works on participant submissions, there is no magic genie that assembles this data.
It's a team of volunteers and people that submit data and keep it correct.
Why you would pay for Provoice and Dmr for 2 radios without verifying is unwise as well.
Is the DMR that you purchased it for Enc?

On my 436s and 536 encrypted comes through as garbled sounds like a bunch of people in a street fight. You may want to check Radio Reference and see if they’re encrypted. Also if those talk groups are available on Broadcastify or one of the cellphone scanner apps you can compare.

I was wondering why PV and DMR was purchased to monitor a P25 system,
too, and also if the DMR was encrypted (if there IS any DMR involved).

Maybe another good question would be why these were purchased if they
are not intended to be used. Or is that money that need not have been
spent? Or perhaps this is just a case of throwing money at a problem and
finding out money is not the solution.

Also a simple Google search on a specific town will sometimes confirm that they have gone to encrytion. In my case I confirmed this by doing a Google search on" Stratford Police, Stratford, Ct". You will see various comments that they recently went to encryption, Gil

Mark, I read him to say it was $700 per radio which included the $100 charge for two of the add-on upgrades. So, he paid $600 for each radio before the add-on’s.

Bill,

I did not buy them hoping I could receive Encrypted Communications.

I took several people's word that the new system would not be encrypted.

As well as looked the system up on RRDB.

1 was a police chief in one of the local municipalities and 2 – other law enforcement officers as well as a volunteer fireman.

When they 1st started testing this system I could receive it crystal clear. I was very happy.

That was several months ago and just overnight the powers to be who run the 911 emergency center decided to encrypt the Radios.

I found this out late last night. There are people complaining about it big time.

I could see them encrypting a few channels like for SWAT, Homicides and Drug stuff. But to block everything….????

Joe M,

Right now all that is left on the old system EDACS / ProVoice

Is The City of Mobile’s Fire / Rescue EMS

And on that same system in The County all that is left is the same. Fire / Rescue EMS

And they too are going to be switching over to the Harris Radio P25 Encrypted System soon!

Thanks’

Thomas

P.S. I do not like listening to Trains, Planes, etc.

Subject: Re: [BCD536HP] Help On System

There is nothing in your area that is not encrypted?

(which I know cannot be true)

As for RadioReference, it's likely the best nationwide source, but is
not 100% accurate (some would say far less). That has been discussed
many times.

Still, it is clear there was a lack of research prior to purchase.
Further, you should be able to sell them for nearly what you paid since
they hold their value well, so it's not like you are out over $1400 in
any case. (again, provided there is nothing else you want to listen to)

Kevin the seller will not take them back. As he put it,

I would have to send 2 back and get reimbursed for 1.

I had rather use them as door stops!

Thanks’

Thomas

<BCD536HP@yahoogroups.com> wrote:

Rick,

Just a warning to anyone that uses RadioReference to see if a Digital system is ENCRYPTED or NOT!!!

I went by what was on RRDB and it showed all to be just (D) digital UNENCRYPTED except for 1 (DE) Digital ENCRYPTED!

I am out of over $1,400.00 and does not include the pre-programming on each 536 for 2 Counties on each.

Now they are just expensive door stops!!!

On my 436s and 536 encrypted comes through as garbled sounds like a bunch of people in a street fight. You may want to check Radio Reference and see if they’re encrypted. Also if those talk groups are available on Broadcastify or one of the cellphone scanner apps you can compare.

“If you paid...”

Making it all that more imperative some of that group expertise I spoke of takes a look at his problem. It’s bad enough at$1000, never mind $1400!

Joe M.

At the time of the 2 upgrades mentioned The City of Mobile was on ProVoice but using the EDCS system that the County uses.

The only way to receive them was to upgrade to ProVoice.

The DMR I upgraded to has some other things I listen to at times. The DMR systems I listen to are not Encrypted.

Thomas

Subject: Re: [BCD536HP] Help On System

I was wondering why PV and DMR was purchased to monitor a P25 system,
too, and also if the DMR was encrypted (if there IS any DMR involved).

Maybe another good question would be why these were purchased if they
are not intended to be used. Or is that money that need not have been
spent? Or perhaps this is just a case of throwing money at a problem and
finding out money is not the solution.

Yes Gil. A simple “google it” gets results most always. If it’s not a local news clipping, there are other listings. Good catch!

Bill

If this just happened overnight I can understand the frustration against the system admins, but not against anyone else including RR or anyone else who may have been taken by surprise just as you were.

At least you can still use it for DMR (and I suspect other things).

If enough people complain maybe they will make some of it clear again.

Thomas, you write;

“I did not buy them hoping I could receive Encrypted Communications.

I took several people’s word that the new system would not be encrypted.

As well as looked the system up on RRDB.

1 was a police chief in one of the local municipalities and 2 – other law enforcement officers as well as a volunteer fireman.

When they 1st started testing this system I could receive it crystal clear. I was very happy.

That was several months ago and just overnight the powers to be who run the 911 emergency center decided to encrypt the Radios.

I found this out late last night. There are people complaining about it big time.

I could see them encrypting a few channels like for SWAT, Homicides and Drug stuff. But to block everything….????

Thomas”

It sounds like if enough people complain you may at least get the FD back in the clear. Find out as much as you can about who else is complaining, a good bet would be members of the FD. The firefighters have family and friends who monitor-you take that away and there will be such a row the town fathers will be getting into it. Organize and hit up your town or city reps. Nothing to loose! Especially if it happened the way you describe. Absolutely no indication beforehand putting people at ease and then springing encryption on all at the last minute. That tells me they may have known of opposition to encryption and deliberately kept it a secret until they thought it was too late for anyone to do anything about it. And regardless of the accuracy of what I just said, if they can’t defend what they did, you should push it. Scream bloody murder! Make it stink. Draw as much attention to it as possible. You may just get them to make a few concessions.

Good luck,

Bill

Guaranteed it didn't happen overnight. This is one reason people should go to their city/county meetings. Raise concerns BEFORE not after encryption.
Some think it's for officer protection yet they forget they are here to serve US and that going encrypted puts US in danger and actually can be a bigger threat to officers as well. It's an easy fix though. All dispatch channels should be in the clear and only two or three encrypted channels are needed no matter how big the department is.

Thomas,

Two points on your gripe session about loosing over $1400...

First and foremost, it is common knowledge that RR gets its data from regular people like you and I who volunteer input of known systems. There may be some vetting of this input but again, it’s never a guarantee that the data will be all and everything. And RR isn’t shy about making people aware of this. It’s on you to vet the data before spending your hard earned money. RR is not at fault for the unfortunate situation you find yourself in.

Secondly, you are NOT the proud owner of a couple of boat anchors costing $1400. You obviously had your heart set on monitoring the encrypted system but it’s time to repurpose the scanners... get your heart set on monitoring something else, or sell them outright and take a loss. But it certainly won’t be a $1400 loss!

Beating yourself up over this is not the answer. All are sorry it happened but had we known beforehand we might have helped you decide what your choices were or if you had any to begin with.
Another hard lesson in life. You are not alone. You’ve just joined the biggest club in the world!

Good luck going forward,

Bill

This whole deal with the County purchasing new Radios from Harris I think it was back in 2007 has been a debacle to say the least.

The have sit in a warehouse In Chickasaw, Al since they were purchased years ago. They are even no longer in warranty.

2 of the main people that was involved in purchasing these radios are no longer with the County.

There was a public meeting of sorts!!!!? People were told that it would not be an Encrypted Radio System except those channels

That they felt was for special opps, and so on.

It is too late for people to ask for a hearing. This County doesn’t care about anything but collecting their taxes.

I know for a FACT that there are some municipalities are PROFILING OUT OF STATE vehicles.

1 example a little over a year ago I heard an officer that was following a car out of TEXAS. His supervisor asked if he had the vehicle stopped?

He replied no, that he had no reason to light him up. Supervisor said go ahead and light him up and pull him over and tell the

Driver the reason he was stopped was because his right front tire went over the white line on the right-hand side of the road.

But in reality the driver didn’t. Next communication I heard was the shift supervisor was on the stop and called for a K9 unit.

You guessed it ! Searching for drugs! The vehicle was going North on I-65.

Just a few nights later the same City pulled over a vehicle from North Carolina using the same reason,

But this driver was going South on I-65.

Google it up about Mobile Counties Radio woes and what all they spent.

After 10 years and out of warranty they are putting in all units throughout the County!

Tax Payer Dollars Really @ WORK!!

You're preaching to the choir John. I've been saying that for years... so much that now I wouldn't care what my local police do... not that I'm aware of any interest they may have with encryption. I'm getting up there in age and don't have the time to engage in some nonsensical banter over encryption. I really don't need to monitor them but I suppose we could consider bugging the cruisers. I say that tongue in cheek, but thinking about it is scary. It wouldn't be that difficult to bug a radio system and I'm sure it's being done. Of course, those who are doing it aren't about to advertise it!

Well you just explained WHY they went encrypted. Either they were already sued or they want to avoid lawsuits, so they can't afford the public hearing (or worse - RECORDING) what they are doing.

It would appear they believe they are above the law and are part of the reason for some of the movements in this country.

Things are returning to law and order, but it can't happen fast enough.

In the mean time, they believe you have no right to know what they do.

As was said - make a stink about the broken promises. The only thing that makes a politician do something is money or the threat of being voted out. Either buy them off or vote them out. (or move somewhere that has more honorable public servants)

From: bill.riches@...
Topic: 5367 Message: 5367

Any improvements or updates for poor muffled audio on P25 X2 systems for a BCD536HP? Analog audio is fine.

73,

Bill, WA2DVU
Cape May, NJ

You can make sure the firmware is current; otherwise you'll have to adjust the settings for that system (or the system itself has issues.

Current firmware decides P25 nicely on my 3 BCDx36HP.

HNY,
Rick WA6NHC

You can also put a tinny speaker on the scanner.

5371. Priority Question

Yahoo group: BCD536HP
Date: 2018-01-09 21:48:43 UTC
From: TLFerg53
Topic: 5371 Message: 5371

Using the BCD536HP and BCD436HP, I like to enable “Priority” on our local fire department frequencies so they will override any other conversations in progress if they are called out. However, with the interval set even as high as every four seconds, this causes a break in any regular transmissions, and often valuable information otherwise. This was the way it was even with old model scanners as well. Is there anyway around this?

Thanks,

Tim

Use a second dedicated receiver. No single receiver
can tune to multiple frequencies simultaneously.

Sounds like a good option, Joe, thanks! I do have a feed to the Internet through Broadcastify that allows two-channels of which one could be dedicated to fire. Will have to check into that.

Thanks!
Tim

Loosing that annoying “break” is not an option when using priority. I rate priority as a must have feature but never use it because I don’t have to. Instead, I have 4 scanners. So, instead of priority, I dedicate each Scanner to a single channel or group of channels. I know this doesn’t help if you haven’t a second receiver but the priority feature needs that “break” or it wouldn’t work.

I had a similar situation. I recently got into ham radio. I now use my ham handheld to monitor fire stations. It works well if the signal is not digital and they transmit or simulcast dispatch on a VHF or low UHF frequency. You can listen to one/two/scan FD frequencies. For about $75 you can listen for two days without a charge if you have an extended battery. Just need to be sure you don't transmit on their channels. YouTube has a how to.

From: JD Haury
Topic: 5371 Message: 5376

Most HTs are designed where you can only transmit on the designated bandplan that is open on the radio. I also carry a quad band HT and have my area FD simulcast call out frequencies programmed in there, comes in real handy when you’re mobile and don’t want to carry around two or three radios.

I lease my car so I cannot install any radios, therefore I do carry several handhelds when I travel – right now my go-to handhelds are a quad band Yaesu VX-7R, and a Whistler TRX-1. Believe it or not I still carry an old Bearcat 200XLT as well. I use it to scan for FRS and GMRS radio traffic while at the same time using the Close Call feature on the TRX-1 for hotel maintenance and security frequencies.

You write... “Most HTs are designed where you can only transmit on the designated bandplan that is open on the radio.”

While true to a certain extent, especially with the major 3 or 4 manufacturers of ham gear, there are now ham radios (imports from China) that allow for dual purpose. Both ham, business band and public safety. They can transmit on any frequency, limited by the general coverage receiving capabilities of the radio and the mandated cell phone restrictions. I too use my ham portables to listen to VHF High band and UHF public safety agencies. But when using the programming software that came with the radio, I always avail myself of that software switch that locks out my ability to transmit on a frequency where I have no right to transmit on. Because of my concern that I may inadvertently/unintentionally transmit on a frequency I’m not a licensed for. And since the first thing you usually say when you “push-to-talk” is your identifying ham call, I’ve just told everyone who’s listening exactly who I am and where I live! Not a good thing to do!

This ability was not available without a mod change on previous ham radios with general coverage receivers. But today, with the allowance of dual purposing your gear, it’s going to create a problem. More and more occurrences will become apparent, be them accidental or deliberate. And the FCC doesn’t care how or why it happened, just that we didn’t take the necessary precautions that it didn’t happen. The fines are very expensive and may include loss of license.

Additionally, if you are both a ham and a member of a volunteer fire Dept., like myself until I retired, keep in mind your personal ham portable, while capable of transmitting on your FD frequency, is not certified for public safety. Portables designated solely for public safety agencies are usually certified as “intrinsically safe”. It’s a standard that insures the gear is manufactured in such a manner as to not allow for the radio to become an ignition source in a potentially hazardous explosive atmosphere. I know of no ham gear that is classified in this manner.

Why I said ‘most’ HTs, as I know there are some of the inexpensive Chinese radios (Baofeng comes to mind) that can wreak havoc on public safety frequencies. While I am aware that some nefarious people will seek out a radio for that specific intent, most of us are respectful of the bandplan and our fellow hobbyists. But not all. The other night I had to lock out my favorite 2m repeater because some idiot was blasting some kind of hard rock music with lots of profanity. It went on all…night…long. Sad.

Not quite…

A ham radio won't go out of band without mods. If it does, it's not type accepted for "ham" radio and therefore not a "ham" radio. What you are describing from China as dual purpose is a commercial radio that happens to cover the ham bad. That is type accepted for commercial use. And since hams have been always been allowed to modify commercial radios for ham use, the mod (even though software) is legal to use on ham bands .

Hi: The FCC is mentioned below as a regulating agency can make your life miserable if you violate the law. It is more likely that the Local FD PD and EMS agencies will work together to locate and identify anyone that is causing interference or operating unlawfully on their authorized frequencies.
I have been part of several tactical operations to locate transmitters that were interfering with PSB communications. In all cases the interferences was created by agency(s) owned equipment malfunctions.
I am also aware of an incident that occurred back in 2006 where a WalMart Greeter was charged with a felony by the Wytheville PD. Not clear as to exactly what happened but what I heard was the ham radio operator was monitoring the local PD and his speaker mic shorted and keyed the transmitter. From what I understand the PD listened to the transmission and identified that It was someone at Walmart.
Another version of the story was that the HAM radio was being used on MURS and bled over. Search warrants were issued, the house was tossed, radios, computers etc. were taken as evidence.
The defendant spent many dollars on lawyers and I am sure spent some sleepless nights. The prosecutor dropped the charges and no further action was taken, but the dollars spent and the impact it had on someone's life can not be reversed.
A lot of municipalities and states have laws on the books relating to willful or unintentional interference. I would guess that local prosecutors could charge someone with interfering with a police officer even if they did not have a local law that covered radio interference.
There is also the case of the Protestor Ferguson that was interfering with operations there, he was arrested and had the radio in his possession and charged, no FCC involved.
As I cross back and forth between PSB and ham use I actually carry PSB radios that are known and authorized and use them on ham frequencies. The ham frequencies are in separate banks to avoid operating errors on my part. I am a big believer in Murphy and rule 1 anything that can go wrong will go wrong. Chris Quirk

Good points Bob,

I don’t question the logic of looking at it from the commercial side as you have pointed out. But I do question how the FCC allowed them to be classified as commercial in the first place. I’m looking at the problem as a radio manufactured for the ham community that allows for dual purpose (ham and commercial)... and you have pointed out the gear was created for the commercial side with an “Oh, by the way”, it also allows for ham usage. Either way, I don’t believe it was the intent of the FCC to permit the two services to be so easily combined into what was previously accepted as the norm, a single service piece of gear. I specified “service” so as not to confuse it with bands. A fire radio used to be dual band for example but not dual service. Notice I said “used to be”.

Thanks for the update. You’ve got me back peddling. Now I don’t know what to think! But I still maintain it’s the Chinese who are flooding the market with cheap radios that can come up on commercial, public safety and ham without any modifications and cause an increase in interference.

Bill

Not quite…

A ham radio won’t go out of band without mods. If it does, it’s not type accepted for “ham” radio and therefore not a “ham” radio. What you are describing from China as dual purpose is a commercial radio that happens to cover the ham bad. That is type accepted for commercial use. And since hams have been always been allowed to modify commercial radios for ham use, the mod (even though software) is legal to use on ham bands .

You write... “Most HTs are designed where you can only transmit on the designated bandplan that is open on the radio.”

While true to a certain extent, especially with the major 3 or 4 manufacturers of ham gear, there are now ham radios (imports from China) that allow for dual purpose. Both ham, business band and public safety. They can transmit on any frequency, limited by the general coverage receiving capabilities of the radio and the mandated cell phone restrictions. I too use my ham portables to listen to VHF High band and UHF public safety agencies. But when using the programming software that came with the radio, I always avail myself of that software switch that locks out my ability to transmit on a frequency where I have no right

to transmit on. Because of my concern that I may inadvertently/unintentionally transmit on a frequency I’m not a licensed for. And since the first thing you usually say when you “push-to-talk” is your identifying ham call, I’ve just told everyone who’s listening exactly who I am and where I live! Not a good thing to do!

This ability was not available without a mod change on previous ham radios with general coverage receivers. But today, with the allowance of dual purposing your gear, it’s going to create a problem. More and more occurrences will become apparent, be them accidental or deliberate. And the FCC doesn’t care how or why it happened, just that we didn’t take the necessary precautions that it didn’t happen. The fines are very expensive and may include loss of license.

Additionally, if you are both a ham and a member of a volunteer fire Dept., like myself until I retired, keep in mind your personal ham portable, while capable of transmitting on your FD frequency, is not certified for public safety. Portables designated solely for public safety agencies are usually certified as “intrinsically safe”. It’s a standard that insures the gear is manufactured in such a manner as to not allow for the radio to become an ignition source in a potentially hazardous explosive atmosphere. I know of no ham gear that is classified in this manner.

The quick answer is that there isn't supposed to be any front panel programming available to a user; in theory requiring a technical person (that is presumed to know the laws) to program it.

With the Chinese radios I have, that rule mostly applies and even their inverse, upside down, bass-ackword twisted programming logic puts the rule in the gray (it just isn't 'normal' linear thinking). Of course the programming software makes it much easier, so the programmer again is supposed to follow the (weakened) laws as a presumption of being technically qualified. It's just like the commercial radios I own, I could use the official software to program it as I saw fit, but there is only so much that is enforceable until an issue arises.

Many come with FRS already loaded though they have too much power out for that use.

I use scanners to listen to those services, not my ham gear; making it an intentional move to be able to operate on the local services channels.

There is only ONE viable ham repeater here, cell coverage is variable. What I've done on one of my radios is to have one codeplug for ham use and another is set up for all the fire/SO frequencies in my county 'just in case'. I have to actually change codeplugs to enable that (no accidental transmissions), the radio is commercial type accepted (and NFM capable, so 'legal') and the local chiefs (and Sheriff) know who I am (former professional fire line Captain) so if I needed to use it, there would be no issues. I haven't, don't intend to, but I am ready should it be needed. That falls under hope for the best while you plan for the worst.

In the US, the FCC rules allow ANY use of any radio in the case of an emergency WITH a followup letter to the FCC after the fact explaining WHY the rules were violated. Emergency is specifically limited to immediate threat to life in this case (sinking ship is the typical example).

A license is not required in the US to buy ANY radio, it's the transmitting that requires the license (an action, not the hardware). No that is not splitting hairs.

Anyone can buy any commercial radio the budget allows, even those capable of trunking and encryption. At that point, what keeps an unauthorized user off the network is the 'key' to get into the system and in most if not all cases, the transmitter ID (part of the data stream for trunking) must be known to the network controller (which is an effective way to lockout stolen radios).

That at least keeps most of the illegal use out, except for a really serious interloper. Or the 'backdoor' key required for interoperability perhaps.

That's why those units with Part 90 certification have a lockout on the keypad programming. For Part 90 TA, that lockout must be enabled.

That said, let's wrap this thread up soon, as it's off topic.

Unless they changed the rules in the past 30 years, the FCC’s definition isn’t the one I was taught. An emergency is an immediate threat to life or property. The FCC couldn’t have cared less on this violation I filled in QST Magazine. A ham in Ca came up on a public safety agency’s frequency to report finding an injured hiker using a ham portable that was modified to transmit outside the ham band. There was no ham or cell coverage either. Their argument was he could have hiked back out to where he could have access to a phone. That sounds heavy handed for an act that contained nothing more than a request for help.

Rick,

You covered the trunking but at issue here are the conventional analogue comm Systems where no radio ID’s or keys are required. There may be an exception to this If when an offending radio comes up on frequency without an ID, the system has the capability to ignore. I doubt that is the case with most analogue conventional. But even if there was the capability of blocking access, there’s still the matter of a transmitter keying up on the frequency. It could interfere with the authorized traffic. Ex: transmitting raises the noise floor.

HI; Nothing stops a LE, local city attorney, DA or other authority from charging you with obstruction or interference. Although you are likely to prevail the dollar cost to defend is not minor. The toll on you nerves and stress are a bigger factor. Most of the time the conversation comes down to were there other methods to communicate ? Was the victim in immediate need of assistance ? A broken arm probably not, patient non responsive with head trauma most likely.
If you feel the need to do this be prepared and think through what you are doing, and the steps you took to verify no other methods were available and this was your only option.
Also remember some departments do not want any involvement from volunteers or non department individuals, although this is getting better their are still some out there.

Or, make sure Location Control is enabled for that Favorites List and set your location. The scanner will automatically avoid all distant sites.

So if I didn’t want to go the Location route, I would have to sit down for however long it takes and avoid every site on the Ohio MARCS IP system that I don’t want to listen to? And I have to do this for every separate Fav List of TGs I make that is derived from the MARCS IP system?

Yes, but "however long it takes" would only be a minute or two.

I would avoid all sites (AVOID one then copy-n-paste that field to the
rest) then re-enable the close one(s).

You could also copy the updated site list to your other FLs.

From: Kevin Tribbe
Topic: 5395 Message: 5400

Also in Ohio under the MARCS system. I would recommend deleting the other counties. Much cleaner. Just click on the first one and then the last and delete from the favorite list - simple.

Another lesson I just learned about MARCS is there are some many towers it may overwhelm your scanner and make it skip channels. Experimenting with manual thresholds to reduce errors and improve coverage.

Sure do - it takes all of 2-5 minutes in Sentinel, once you get the hang of it. (You can drag and select a "whole bunch at 1 time) and then avoid or delete.

Even using location control, you will still have it going through several sites you can't receive.
Just load the 2 or 3 sites closest and that you can actually receive - except in Columbus, some agencies use ONLY one simulcast system(site), some others. Might be true in other major cities as well.

You have to avoid the tower sites out of your range , Unless you are using gps then you would set your range in that instance and only the tower sites in your specified range will be scanned.

From: Kevin Tribbe
Topic: 5403 Message: 5403

Anyone know a good source of documentation for BCD436/536HP scanners? Looking for good definition of each concept and how they all relate and work together. Just seems to be too many options with no explanation on how they relate or suggestions on how to proceed.

What he is looking for is a basic functionality theory.

I don't know of any such site offhand, but many people don't understand
the manuals due to the lack of basic scanner terms and concepts.

I would just Google any terms or functions you don't understand.

Topic: 5403 Message: 5406

One of the first obstacles I ran into with the BCDx36HP had to do with a notation that read “Nothing to Scan”. Somebody offered up a checklist, things to look at and correct to get the scanner to function... I post this here but have no remembrance of where it came from. My apologies to the author for my not giving credit.

X36HP "Nothing to Scan" Checklist

Scanner Checklist:
1. A location has to be set in 'Set Your Location' to monitor the Database.
2. You must enable at least one Favorites List or the Full Database in 'Set Scan Selection>Select Lists to Monitor'.
3. Favorites Lists or Systems with QK's assigned to them must be enabled with QK's or in 'Set Scan Selection>Manage Quick Key Status'.
4. Make sure 'ID Search' is On for the system if no IDs are programmed.
5. Service Types for the channels you want to monitor must be set to On.
6. Any FL with 'Use Location Control' set to On must have locations programmed for the Departments and/or Sites.

If you are programming everything in Sentinel first and sending it to the scanner:

Edit Profile>Scan Selection tab: Make sure 'Monitor' and 'Download' are On for FL's you want to scan.
Check or uncheck 'Monitor Full Database'.
Edit Profile>Service Types tab: Make sure the Service Types you want to monitor are checked.
Custom 1 is needed for miscellaneous channels.
Edit Profile>Location Settings tab: Make sure you have a location programmed for scanning the Full Database or FL's with 'Use Location Control' set to On.
Edit Profile>Quick Key Status tab: Make sure FLQK's are checked for FL's you want to monitor.
Edit Favorites List>System QK Status tab: Make sure SQK's are checked for systems you want to monitor.
Edit Favorites List>System>Options tab: Make sure 'ID Search' is On if no IDs are programmed.
Edit Favorites List>System>Dept/Site Quick Keys Status tab: Make sure Department/Site QK's are checked for departments/sites you want to monitor.
Edit Favorites List>System>Dept/Site>Location tab: Make sure Departments/Sites have locations programmed if 'Use Location Control' is set to On for the FL.

For me, personally, I find “Mark’s Easy-To-Read Scanner Manual” not all that much “easier” than the one that Uniden provides. In my mind, there is much more that can be done to make it even easier.

That's because both assume a basic knowledge
of communications terms and scanner concepts.

The analogy I've used many times is that they will both tell you how to
operate a car (where the gear shift is, where the gas and brake are -
and clutch if applicable, where the turn signal is, how to change the
bulbs, where the fuses are, etc.) but no car manual will teach you how
to DRIVE. It's assumed you have that basic knowledge prior to reading
the vehicle owner's manual.

Thanks Joe, good to give credit where credit is due. The list helped instillconfidence in me when those first days with a new radio increased the frustration levels.

A starter would be for someone to write “The Uniden BCDx36HP Scanner for Dummies”, especially for novices like me with ADD. This list is full of valuable information from many intelligent people that apparently understand the inner workings of electronics from the inside out, yet their posts often are geared toward others with working knowledge of the scanner and the areas where it’s different in-depth features are used around the country.

For instance, what’s the difference between analog and digital and what do we need to receive either. And what about encryption vs non-encryption, is it in my area? Why can’t I “unencrypt” radio transmissions? And what is “Trunking” and how does it work? And then there’s, well, the list goes on and on. A down-to-earth reference book that walks you through the different features of the BCDx336 series and how to use them would be great, and not written like the manual.

When you purchase a new HD TV today, it comes with a bunch of features, too, that the novice doesn’t always understand, they just want it to work while others want each and every feature up and running. The manual? Maybe, maybe not. Most likely a friend (like those on this list) that knows how they work and how to get it to do what they want.

In the end, there are those smartphone apps that allow you to listen in on a scanner someone has already programmed and set up, not necessarily maybe the way you would prefer, but sure takes the headache (and fun) out of it.....

Although I have two FL’s set up the way I like on my 436 and 536, I know that they aren’t quite the way those on this list would have done it as I read the threads here each day, but they work, for now. Boy, I sure did like it back in the day when all you had to do when you wanted to add a frequency was go to the local Radio Shack and buy a new crystal.

From: MCH
Topic: 5403 Message: 5413

Actually, “The Uniden BCDx36HP Scanner for Dummies” is what you don't want.

What is needed is "Scanner Basics" or "Basic scanner concepts". We have manuals that tell you how to operate features on specific models. What is needed is something to explain what the features are. For example, "What is a lockout/avoid?", "What is a trunked system?", "What is a talkgroup", "What is a frequency?", "What is DMR?", Etc. All your examples are excellent, too.

The rest of your post is dead on, but any scanner concept book should specifically NOT be driven toward any particular model, as it applies to all models (or most - or several). Note the sample questions - they don't just apply to the x36.

Yes - crystals were great, but the 210/100 type programmable scanners were much better since you need only enter the frequency (no crystals). I would say that was the peak of scanner nirvana. Or maybe when they increased the channels to allow multiple areas.

There have been a number of significant milestones for scanner development (CTCSS/CDCSS, trunking, DMA) but the industry is still progressing faster than scanner development. Every time they decide to consolidate all the digital modes, they only end up with all the previous modes plus a new one. Few have died out. Some such as AEGIS, VSELP, and even Motorola Type I are nearly extinct. You could even put Open Sky on that list. The big players today as P25, DMR, NXDN, and D-STAR (and maybe FUSION). Almost all of those are unique to a certain type of radio service. (P25 for PS, DMR/NXDN for B&I, DS/Fusion for ham)

From: Mark Lassman
Topic: 5403 Message: 5414

I go back to the 70s and the old 4-channel crystal scanners. Now THOSE were the days!

There actually IS a “Scanners For Dummies” book, but likely it doesn’t go into ENOUGH detail as regards specific scanner models. But I would gladly buy such a book if they were available for today’s modern scanners.

Right, like when the answers start out with “All you have to do is…”, presuming the rest of us know what they’re talking about.

Nor should it! That would only serve to confuse those with other models. Can you imagine reading how to simply program in a frequency for several brands of scanners which use different methods? *I* would be confused by that! And why would I care that brand X uses a program button while Uniden uses an ENTER key? Or that MANUAL is used on one model but PAUSE on another and HOLD on another?

The details are found in the owner's manual for the model you have.

***** Once you know the concepts the manual is easy to understand. *****
That's why some are confused by the manual and others are not.
Those who say the manual is crap say that because they don't know the concepts. It's like reading a book that is written in a language you don't know (which is very close to exactly the issue).

The concepts book explains what a trunked system is - how it uses talkgroups and frequencies and sites and the relation among them. You learn those terms (AKA what 'drive, reverse, and park' mean)

You also learn bank/channel vs DMA as well as the differences of each type of setup and the details of each, and simulcast vs zones.

Then you use the OM to tell you how to program talkgroups and frequencies and sites in your model.

I think the most important asset needed when programming these new scanners is patience. I am just now beginning to grasp the 536 and able to program it and feel like I am getting somewhere. I went a couple of months just locked onto my local dispatch without scanning at all. Once I learned the concept of avoiding all the other systems in the Ohio MARCS IP statewide group and zeroing in on mine and mine alone did the aspect of programming suddenly get easier. I still have a few glitches in my set up that I need to understand and make the changes to, but now I feel that they are just bumps in the road. There are so many functions and features that have to be just right to operate this scanner in an efficient manner, you just need to be able to take a deep breath and address each one of them at a time and not feel overwhelmed. I bought a 436 a year or so ago and got so frustrated that I sent it back within 30 days. Now I have the 536, a Whistler WS1065 and the handheld TRX-1 and I am determined to conquer each of them. I am well on my way thanks to the help and patience of the people in groups like this.

Thanks, Joe, your last paragraph is actually a good start to a “Scanner Basics” book and answers a nagging question, why so many different types of systems? Because of all the different types of radio equipment out there? And the need for a scanner to tune them in?

I think we were fortunate to live in an area that is 90% non-digital, no encryption from all the different posts and problems different areas of the country have. And we definitely have a panel of experts that understand each of these and how to program a scanner to get them to work, then they change the rules....

By the way, why does digital sound so funny on a scanner like the 436 or 536? Does it sound that way in the patrol cars and at dispatch? The Illinois State Police and a local county sheriff’s office are about the only digital systems in the area although the range appears to be much farther than analog.

I've had mine (536) for about two years now, and I'm STILL tweaking it. Adding things, taking things away, changing the FLs around. It's a work in progress, definitely. I'm curious, though, as to why you sent the 436 back. It works exactly the same as the 536, you'd have been equally as frustrated with either radio.

Joe,

The takeaway from your analogy (“but no car manual will teach you how
to DRIVE. It's assumed you have that basic knowledge prior to reading
the vehicle owner's manual.”) is if you DONT have that basic knowledge prior to getting a car, you shouldn’t be driving! Applying that analogy to our pastime means what? Driving abilities are usually measured in the form of successful completion of drivers ed courses or a valid drivers license... if you don’t quality, you shouldn’t be behind the wheel. So... going forward, if you don’t have the basics of HOW a scanner functions you shouldn’t be buying one?

Having said that, I like your analogy, it’s the closest one I’ve seen until a better one comes along and I don’t see that happening anytime soon! I believe the point you make has not been lost on me. Which is when it comes to getting a scanner to perform successfully , there is a need to understand the concepts/terminology of the scanner before an understanding of the “drivers” manual happens.

Bill

Thanks Joe, good to give credit where credit is due. The list helped instillconfidence in me when those first days with a new radio increased the frustration levels.

On Jan 14, 2018, at 6:48 PM, MCH mch@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

That's because both assume a basic knowledge
of communications terms and scanner concepts.

The analogy I've used many times is that they will both tell you how to
operate a car (where the gear shift is, where the gas and brake are -
and clutch if applicable, where the turn signal is, how to change the
bulbs, where the fuses are, etc.) but no car manual will teach you how
to DRIVE. It's assumed you have that basic knowledge prior to reading
the vehicle owner's manual.

A suggested reference would be the RadioReference.com Forums. Spending a day or two jumping around that site will help and also afford other sites that can help.

On Jan 14, 2018, at 7:23 PM, tferg53@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

A starter would be for someone to write “The Uniden BCDx36HP Scanner for Dummies”, especially for novices like me with ADD. This list is full of valuable information from many intelligent people that apparently understand the inner workings of electronics from the inside out, yet their posts often are geared toward others with working knowledge of the scanner and the areas where it’s different in-depth features are used around the country.

For instance, what’s the difference between analog and digital and what do we need to receive either. And what about encryption vs non-encryption, is it in my area? Why can’t I “unencrypt” radio transmissions? And what is “Trunking” and how does it work? And then there’s, well, the list goes on and on. A down-to-earth reference book that walks you through the different features of the BCDx336 series and how to use them would be great, and not written like the manual.

When you purchase a new HD TV today, it comes with a bunch of features, too, that the novice doesn’t always understand, they just want it to work while others want each and every feature up and running. The manual? Maybe, maybe not. Most likely a friend (like those on this list) that knows how they work and how to get it to do what they want.

In the end, there are those smartphone apps that allow you to listen in on a scanner someone has already programmed and set up, not necessarily maybe the way you would prefer, but sure takes the headache (and fun) out of it.....

Although I have two FL’s set up the way I like on my 436 and 536, I know that they aren’t quite the way those on this list would have done it as I read the threads here each day, but they work, for now. Boy, I sure did like it back in the day when all you had to do when you wanted to add a frequency was go to the local Radio Shack and buy a new crystal..

5421. RE: [BCD536HP] Documentation

Yahoo group: BCD536HP
Date: 2018-01-15 18:15:53 UTC
From: JD Haury
Topic: 5403 Message: 5421

Yes, I sent the 436 back to Scannermaster simply due to lack of patience and frustration. I had a lot on my plate at the time, didn't have the time to devote to it or any more hair to pull out. I acted impulsively and one day, when I bricked it, I threw my hands in the air and the scanner back into the box.

Then I got a chunk of change a year later and, after a pep talk with myself and some online research, decided to rededicate to the hobby and ordered the BCD536HP, the Whistler WS1065, and the Whistler TRX-1 at the same time. I also ordered an SDR dongle (using SDR♯), a used Pro-2051 on eBay, and a 2m base station Icom IC-746PRO from the Ham Station. I am thinking about buying another 436 and a TRX-2 on down the line. I made a pledge to not get discouraged with the new technology and to take my time learning these new scanners. I feel that I am making very good progress, as I said before, thanks to groups such as this, the RR Forums, and the Yahoo Groups. When I read that someone is so frustrated with one of these radios that they are ready to toss them out the window or back into the box, I sometimes send them a note and tell them how I felt at one time, and how I rose above it and stuck with it and tell them about the progress I am making. I found that patience is the main ingredient to success when it comes to the new radios on the market today. I cannot count how many configurations I have been through before one worked for me the way I wanted it to. I am a long way from perfecting the programming process, and I am tweaking everyday, but each time I upload to the scanner I feel a profound sense of victory.

With that patience, I am making progress. One day at a time.

Subject: Re: [BCD536HP] Documentation

I've had mine (536) for about two years now, and I'm STILL tweaking it. Adding things, taking things away, changing the FLs around. It's a work in progress, definitely. I'm curious, though, as to why you sent the 436 back. It works exactly the same as the 536, you'd have been equally as frustrated with either radio.

On Jan 14, 2018, at 6:14 PM, JD Haury kf4anc@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

I think the most important asset needed when programming these new scanners is patience. I am just now beginning to grasp the 536 and able to program it and feel like I am getting somewhere. I went a couple of months just locked onto my local dispatch without scanning at all. Once I learned the concept of avoiding all the other systems in the Ohio MARCS IP statewide group and zeroing in on mine and mine alone did the aspect of programming suddenly get easier. I still have a few glitches in my set up that I need to understand and make the changes to, but now I feel that they are just bumps in the road. There are so many functions and features that have to be just right to operate this scanner in an efficient manner, you just need to be able to take a deep breath and address each one of them at a

time and not feel overwhelmed. I bought a 436 a year or so ago and got so frustrated that I sent it back within 30 days. Now I have the 536, a Whistler WS1065 and the handheld TRX-1 and I am determined to conquer each of them. I am well on my way thanks to the help and patience of the people in groups like this.

The takeaway is that while you likely won't hurt anyone (unlike operating a car without knowing how to drive), you likely will have a lot of difficulty getting to your 'destination' of proper programming.

We also don't have a test of successful completion of scanner knowledge.

The solution is to learn how to drive or learn basic scanner concepts. Then you will have the knowledge required for the task at hand.

Fortunately, we have recently come into self-driving cars (license requirements unknown at this time) and for scanners that means entering your zip code and selecting Service Types (where you want to go and what you want to pass on the way there). The knowledge part is less important, but both are still valuable skills.

At work, we had a general rule called "The 2% factor". The user needed
to be at least 2% smarter than the tool that was being used.

We used a LOT of shovels in the fire department and some days, it was a
close call for some of the users to meet that rule.

Hang in there and enjoy the learning process.

Since I was the one that started this lively discussion I thought I would try to wrap it up. There were almost 20 comments on my initial questions. There were differing opinions which included a lot of great points. Seems like a shame to waste all this good insight for future owners of a BCD536HP scanner. It is a long arduous journey to be successful. I am planning to capture my learning in a Word document that I will update as I proceed, starting at the top and working my way down into the different topics. I won't have all the answers - probably just more questions. I was thinking of using a Google Doc type ap to share what I find and to get input.

What do you think of this approach? Feel free to share your comments.

Not sure everyone will want to see this in the Yahoogroup so feel free to send me a direct email if you want to participate on the side.

Thanks for all your comments...

Topic: 5403 Message: 5426

There’s nothing wrong with taking notes. I’ve stashed a bunch of them in my cell phone along with the manuals... comes in handy on occasion. And when you become as well versed as Joe for example, you might entertain the idea of posting. But before you know it, the interest in one radio becomes passé as we move on to the next big plato, a newer offering, and the whole learning process starts yet again!

>> I think the most important asset needed when programming these new scanners is patience.

I am just now beginning to grasp the 536 and able to program it and feel like I am getting somewhere. I went a couple of months just locked onto my local dispatch without scanning at all. Once I learned the concept of avoiding all the other systems in the Ohio MARCS IP statewide group and zeroing in on mine and mine alone did the aspect of programming suddenly get easier. I still have a few glitches in my set up that I need to understand and make the changes to, but now I feel that they are just bumps in the road. There are so many functions and features that have to be just right to operate this scanner in an efficient manner, you just need to be able to take a deep breath and address each one of them at a time and not feel overwhelmed. I bought a 436 a year or so ago and got so frustrated that I sent it back within 30 days. Now I have the 536, a Whistler WS1065 and the handheld TRX-1 and I am determined to conquer each of them. I am well on my way thanks to the help and patience of the people in groups like this.

Yes - notes are always good, and since you're writing
them you can write them in terms you understand.

From: JD Haury
Topic: 5395 Message: 5428

I crammed for 3 days on Sentinel, uploaded 20-something different configs to the scanner, avoiding the sites I don't need, etc. and it suddenly worked! I am getting the hang of it now! I have all my systems in there, consecutively numbered and the BCD536HP is finally performing as it should. Still tweaking and still experimenting, but it's all coming together. I'm not the kind of guy to stop a stranger on the street and ask for directions. I would rather pull over and consult a map or GPS, I suppose that's a habit I retained from my truck driving days. Same thing with something like this. I would rather stop what I am doing and learn the system myself instead of allowing someone else to program my scanner for me. I was all ready to pack my scanners in a backpack and take them to a local MONIX meeting and have one of those great guys program them for me, but that defeats the learning process. Now I know the system, I know how it works and how it has to be programmed, and if I hit a bump in the road I pull over and read the map. I love technology and the challenge it presents, and this old dog can definitely learn new tricks!

Sure do - it takes all of 2-5 minutes in Sentinel, once you get the hang of it. (You can drag and select a "whole bunch at 1 time) and then avoid or delete.

Even using location control, you will still have it going through several sites you can't receive.

Just load the 2 or 3 sites closest and that you can actually receive - except in Columbus, some agencies use ONLY one simulcast system(site), some others. Might be true in other major cities as well.

A second scanner dedicated to your local fire department.
Joey VA3GOC

On ☐Tuesday☐, ☐January☐ ☐09☐, ☐2018☐ ☐05☐:☐34☐:☐33☐ ☐PM, TLFerg53 tferg53@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

Using the BCD536HP and BCD436HP, I like to enable “Priority” on our local fire department frequencies so they will override any other conversations in progress if they are called out. However, with the interval set even as high as every four seconds, this causes a break in any regular transmissions, and often valuable information otherwise. This was the way it was even with old model scanners as well. Is there anyway around this?

Thanks,

Tim

I suggest you start at the very beginning and clean the scanner. Then start with the basics and sit down and make a list of your Favorite Lists, what order you want them in, and number them consecutively within the names…like… (1) Local PD…then (2) Local Fire, (3) EMTs, etc etc, then when you have them listed and numbered, go into each one and program it. Make a check list of things you will have to do in each FL such as AVOID other systems, set the service type on, enable the list, set location, etc. Take your time. Go back and research emails from this list with the same topic you are having a problem with, also the RR Forums, YouTube, Google searches, etc. It will eventually all come together for you. Not saying I am even close to having this scanner figured out yet, but I am getting there, and I can only pass on what is working for me.

Thank you. I do have a old Uniden Bearcat 175XL, 16-Channel scanner that I’ve been using to listen to the local airport on Unicom that I’ve been considering using it strictly for FD. Although, since Radio Shack isn’t around any longer, I need to find a place to get a what I believe is a mini-plug-to-RCA-female-jack converter to connect it’s external speaker jack with the other side of my 536’s output to my computer’s stereo input. Don’t really need an outside antenna since they are on repeater, so the antenna that came with it will work.

Tim

From: Bill Nolan
Topic: 5371 Message: 5433

Tim,

Is there a question somewhere in your post?

I suspect you want to learn where to buy the necessary adapters required to take the “audio out” from your old Rat Shack scanner and add it to the “audio out” of your BCD536HP. But you say the “audio out” from the BCD536HP is being fed to your computer, which leads me to believe you are using the Uniden Sentinel software (or other aftermarket software) to control the BCD536HP through the USB programming cable (which also allows for pumping audio to the computer’s speakers)?

So I’m not sure what it is that you are attempting. If it’s just patching two audio streams into the same speaker, and you need Connectors, fine. You can Google it. I have done that in the past and found all sorts of suppliers. I never bothered to remember where I got my stuff because I have a local business called “Cables and Connectors”, stocked with just about everything, staffed with longtime employees/owner who are very knowledgeable. So, I just go for a ride, tell them what I’m trying to do and they set me up with what I need!

I’d be happy to ask about your attempted setup on your behalf if you could elaborate... I’m doubting that the BCD536HP easily allows for adding an additional audio stream to the USB programming cable (if that’s what you are eluding to), but once you can clarify, this group should be better able to help.

Bill

Thank you. I do have a old Uniden Bearcat 175XL, 16-Channel scanner that I've been using to listen to the local airport on Unicom that I've been considering using it strictly for FD. Although, since Radio Shack isn't around any longer, I need to find a place to get a what I believe is a mini-plug-to-RCA-female-jack converter to connect it's external speaker jack with the other side of my 536's output to my computer's stereo input. Don't really need an outside antenna since they are on repeater, so the antenna that came with it will work.

Thanks, Bill. I've had my BCD536's speaker out connected to my iMac's audio in for several years (a BCT15X before that) now steaming the audio to Broadcastify and out to smartphones, tablets, etc., with a police scanner app like "5-0 Radio Pro". You can "listen in" by going to Illinois>Marion County>Centralia Area Police, Fire and EMS Dispatch on such an app. There is another feed, "Centralia Police/Fire, Marion, and Clinton Counties Police, State Police" locally that feeds the local police and fire on the left channel with the rest on the right.

I had to add a ground-loop filter from Radio Shack last spring to eliminate a hum after posting the problem on this list last spring and it worked beautifully. The filter has a left and right channel (red and white RCA male jacks) which I used a Radio Shack part to connect to the mono output of the scanner's speaker jack and am feeding the streaming site in mono. If I had another Radio Shack (or similar) converter/adapter, I could feed one channel with the 175XL's output strictly on local fire and then use the 536's output to feed the other channel with the other frequencies and get around the priority issue I was having with priority activated on the 536.

May not be the most appropriate or perfect way to do it, engineering-wise, but it works. Now if I could get "Siren" to work outside my local area network, I wouldn't need this feed. Using the app on the phone is more convenient that taking a hand-held scanner along, especially when out of range.

I will look up the part on your link or Google it, but Radio Shack was the first thing that came to mind.

Thank you for the suggestion, and help!

To extend Siren beyond your LAN, you'll have to open up (forward) the ports in your router; one port for Siren control, plus ranges for the audio connections. It's 'better' if you use VLC, a free multi-platform app to stream it. (You still have to port forward.)

If you decide to do it without VLC, it's possible (done it) BUT once the 586 exceeds one audio connection (as in when you change from LAN to cell network coverage on your device) the 586 (rightly) resets the connection then it barfs (it quits sending audio). So using VLC as a 'buffer' keeps the connection to the 586 at one ('talking' only to VLC so it's 'happy'), but you can then support more than one simultaneous listener connections (via VLC), limited to your bandwidth or VLC software control.

Hint: Use VLC for the AUDIO portion of streaming (port forward to the computer running VLC), yet forward the Siren control port (to the scanner) and you can use Siren on your device to listen in.

Bonus: this leaves your sound card available for other tasks (otherwise required for Broadcastify or other streaming programs).

Or continue to use Broadcastify for streaming the audio, but open up (forward) the Siren port for your remote control (only); simple, cheap effective (browser listening, Siren controlling). Same cat, different skinning method.

CAVEAT: For Siren or VLC, you must ALWAYS know what your LAN 'public IP' is to let this approach work. Using a dynamic name server makes this easy, but may have a small fee (DynDNS now charges). I just happen to get free dynamic DNS, making it really easy (I use the FQDN and don't care about the IP address, which changes periodically).

I played with this (extending Siren, some with VLC) years ago and got it to work. But for me, it's simpler to use the control and audio apps to manage my scanner/s on my ham station computer, then use TeamViewer (also free and multi-platform) to remotely log into that computer (and hear what it hears, while I can control the scanner/s). I use TeamViewer often for other things (remote ham radio station control, wx station management, web page servers, 6 live critter cams on that computer), making it simpler in general for me to stick with one program (TeamViewer). Yes that is one busy computer but it's still rarely above 10% CPU use.

I still have notes from then, but I've moved so finding the written notes could be an issue. I don't remember the port values, it's why I wrote them down.

5439. GPS not working!

Yahoo group: BCD536HP
Date: 2018-01-23 03:50:03 UTC
From: kb6kgx@...
Topic: 5439 Message: 5439

Several months ago, I notice that the GPS was not working. The red LED on the GPS puck was not lit up and blinking. The radio's display did not show "GPS" on the top line of the display.

I confirmed there is power to the 12VCD adapter as the red LED light is on. And yes, the fuse inside of it is a good fuse. I also confirmed the DIN plug connection for the GPS puck. The DB9 is securely connected to the back of the radio. Everything is connected as it should be.

So, why does the GPS not work?

Today I went to my local HRO store and the manager there told me that I should do a "CPU reset" because maybe the scanner is not "talking" to the GPS puck or doesn't recognize it's plugged in?

I went out to the car and reconnected everything and turned the scanner on to do the reset. But NOW, the display DID read "GPS" and the red LED light on the puck was blinking!

And then it stopped doing it. And hasn't done it since.

What can I do? Is there an easy fix or do I have to buy another GPS unit?

As an update, I found a mini-plug to stereo RCA jacks adapter at the local WalMart and now have my BCD536HP scanning all the channels I programmed and feeding the right-channel of the feed with the BCT15X scanning only the local FD and feeding the left channel. Other than doing some volume fine tuning, this is great and sure beats the constant interruption of the priority feature on the 536!

Thanks, again, for all the assistance!

Before you do anything else, put a meter on that fuse you say is good. You did not say HOW it was checked. If merely visual, use a VOM. I experienced fuses that looked fine but were intermittent. It’s rare but it only takes a second to check. Or swap it out just on principle. The cost isn’t prohibitive.

Could be double-AGC. Try turning it off on the scanner.

Of course, this is based on the actual
sound. A recording would be more helpful.

Digital sounds different and one needs to get used to the different audio, even when working properly.

There also is a phenomenon called "Digital Simulcast Bit Error". All scanners suffer from this. What happens is that the digital signs (1's and 0's) are transmitted from multiple sites in a simulcast system so they arrive at your radio at slightly different times. The 1's from one site cancel out 0's from another site causing the voice to be distorted or to drop off altogether.

If this is what you are getting then try to move the antenna around, shorten it up etc. to find a position that works best. If that doesn't work then you may need to switch to a directional antenna.

“ The 1's from one site cancel out 0's from another site causing the voice to be distorted or to drop off altogether.”

Oh, uh ok... I think. Let’s see, there’s bits and there’s bytes.... never mind.

I guess it’s as good a reason given as my neighboring fire dept who, years ago, when they went to a trunked system, experienced loosing entire transmissions, which they came to explain away with “The computer ate my transmission!” But enough of that.

But even when we “avoid” a site or sites in simulcast systems that xmit simultaneously, it may not eliminate mixing. (Although it should if each site has their own unique ID. I’ve seen a lot of discussion on this topic and mostly ignored it because I’m fortunate enough to having never experienced it. So, I have no concerns. There’s also the question of mixing signals that are out of phase raising the noise floor, adding yet one more problem to deal with. My lack of knowledge of simulcast problems makes this more of a question from me than a suggestion.) I’d try attenuating one site, then another, and another, turning the attenuator on and off in varying combinations until I found the best signal.

City county and state would be needed to help correctly.
Did you also select the proper services and and range?
Is squelch set at 2?
Those are the biggest issues with new users
The other is trying to scan an encrypted system, which reverts to the first question about your location and what you are trying to scan.

To review:

1) using the full (updated) database;
2) enter the zip code
3) enable the services you want to hear*

Once set, back out of the menu to scan; you should start hearing what you've selected.

* not ALL services are generic or accurately assigned; in particular the Fed (and some states), which uses frequencies 'assigned' to other services (Forestry using 'itinerant' or pseudo generic).

When in doubt, enable ALL services, then trim back as needed.

Correct, since all the sites have the same frequencies it's impossible to avoid a site and still not have simulcast issues. The only way you could do it is to have a way to separate the sites and at this point there is no way to do that.

Frequencies aren't always different, that's the issue. But it's rather odd to see the system be Indiana SAFT and the audio being Indianapolis Metro Police who are on the cities system.

I think the key is that the frequencies are not different. I've had the same thing happen when more than one system uses the same frequency.

Simulcast systems would be transmitting the same data. John is talking
about different systems of the same type on the same frequencies.

Topic: 5443 Message: 5463

Nope. With simulcast, all towers are transmitting exactly the same signal on exactly the same frequency at exactly the same time (close enough).

Understood. And it’s not an issue with me as I don’t have to deal with it-just lucky geographically. But I believe Unication, a company that supplies voice pagers among, other things, has found how to reduce/eliminate? Which raises a couple of questions about future scanner releases... is there actually a better way or is Unication blowing smoke up our tailpipes? If there is the ability to reduce/eliminate the simul thing, is it feasible from a cost perspective in the scanner market?

What idiot would assign overlapping frequencies? What happened to the good old days when you needed to be 75 miles away minimum and if there was interference, the “last on first off” rule was enforced. (Of course reasonable thinking allowed for other measures to be used before enforcing the rule, but if all else failed...)

I believe that in John's case, he has an antenna on a very tall tower and is between two systems that are distant enough from each other not to interfere with each other, but he can receive both due to the vagaries of local geography.

5467. Can the HP scan faster????

Yahoo group: BCD536HP
Date: 2018-02-22 02:09:01 UTC
From: rpgaun@...
Topic: 5467 Message: 5467

I have a BCD996P2 & BCD325P2 and programed them identical to my BCD536HP. Side by side on same type (but different for each) antenna system, both the P2s scanned faster and picked up more traffic faster than the HP. About 1/3 the time the HP missed the traffic all together.

Is this common with the HP? Is there a way to adjust the scan?? Any ideas in general to make the HP more efficient?

5468. Re: [BCD536HP] New to the group and frustrated with my new 536

Yahoo group: BCD536HP

Topic: 5443 Message: 5468

Yes sir, that would make sense. Which makes my “idiot” comment uncalled for and I apologize. There probably was no issue with the allocation process. So, what can be done to eliminate or reduce the strength of one or the other? Are the TG’s also the same? I’m guessing attenuating one or the other or directional antenna?

5469. Re: Can the HP scan faster????

Yahoo group: BCD536HP
Date: 2018-02-22 16:29:55 UTC
From: Mark Lassman
Topic: 5467 Message: 5469

The HP wil scan as fasts or faster if scanning only normal analog frequencies. However, it slows down considerably when scanning multi-site trunking systems with lots of talkgroups. I’m no techie, so I can’t explain why. But it just is. Yes, I would expect a $500 scanner to be much faster than it is.

5470. Re: [BCD536HP] Re: Can the HP scan faster????

Yahoo group: BCD536HP
Date: 2018-02-22 16:43:31 UTC
From: Uniden UPMan
Topic: 5467 Message: 5470

The number of channels (talk groups) being scanned has absolutely no affect on trunked scan speed. The most common reason for perceived slow trunked scan speed is having too many sites enabled for scanning (the scanner will spend 1-2 seconds per enabled site).
There is no way to speed up trunked "scanning" of a site. The scanner must dwell on the site long enough to catch all channel grants/updates (i.e. 1-2 seconds).

Topic: 5467 Message: 5471

If you turn off not all but most sites on a trunked system I believe your scan rate will improve. That’s ok if the scanner is used as a base. But if used as a mobile, and your travels take you throughout the area of the entire system, where you need all or most sites active, not so much.

They don't overlap per say. There is about 15-20 miles between the sites coverage area. However I believe they forget RF can go farther than the imaginary boundaries ☐☐

The only way to eliminate the issue is to use NAC validation on the frequencies. I don't know if Unication does that or not.

It may take more than that though as I have talk groups that cross from IMPD to SAFT as they use the same TGID's on both systems.
Not sure how that could be addressed

5475. Re: [BCD536HP] Re: Can the HP scan faster????

Yahoo group: BCD536HP
Date: 2018-02-22 17:51:43 UTC
From: MCH
Topic: 5467 Message: 5475

When scanning a conventional channel, you just look for activity. When scanning a trunked system, you have to decode the control channel data. That takes time (about a full second) to see what TGs are active.

With multi-site, and when those sites are in range, each site must be evaluated.

Joe M.

On 2/22/2018 11:29 AM, Mark Lassman kb6kgx@... [BCD536HP] wrote:
> The HP wil scan as fasts or faster if scanning only normal analog frequencies. However, it slows down considerably when scanning multi-site trunking systems with lots of talkgroups. I’m no techie, so I can’t explain why. But it just is. Yes, I would expect a $500 scanner to be much faster than it is.

NAC validation. Surely they are not using the same NAC on both sites.

Actually it happens on the regular antenna too Paul. I just avoide those TG's now on SAFT.

If it is the ONLY system that needs to be scanned (unlikely), a lower gain antenna, preferably directional pointed to the stronger site would be useful. Ultimately the placement can be made to reduce one site while building up another site. Success will depend on the signal strengths involved, if both are potent, not much can help.

Simulcast puts exactly the same output (format doesn't matter) on multiple transmitters at the same time, the only variance at the receive site would be signal strength and a small phase shift (because of the length of the path).

Keep in mind that this is not a simulcast issue. We have been talking
about two different systems (not linked) that use the same frequencies
and the same TGs and the same format.

The user radios do not have issues since they have NAC validation to
distinguish between the two systems.

Yes, you can use directional antennas to mitigate the issue, but that
will cut down on reception of other systems as well.

Thank you for the correction.

So what can we do to make it so it doesn’t waste time scanning sites we don’t need?

Ok, I came in late, thanks for the clarification. Two desired systems on the same frequency with common TGID.

Two unique systems in close proximity, using the same TG and frequencies is ... less than intelligent and really poor planning (or just lazy). RF goes much further than planned; I once listened to a system that (by license demands) was 'contained' within the county lines; except that I was 90 air miles from the county and could still listen in (directional high gain antenna and 18 db pre-amp).

Site code blocking (NAC) won't help since you want to hear both systems. It's a case that you can't help stupid (planning).

Your only hopes are that they merge systems into one network (wider area coverage), which would force changing TGID and/or frequencies. Or that one of the systems changes the TGID so you have a shot and blocking what you don't want to hear; but doesn't remove the problem of frequency sharing. I'm a little surprised they don't have mutual interference.

Those system planners suck!

AVOID them or disable them using Quick Keys.

If they are not in range, they will be skipped as fast as inactive conventional channels.

You can also use a GPS and limit your range if you want to use location control on them.

You can also delete them if you know you will never want to scan them.

As mentioned previously, the user radios don't have any issues since they use NAC validation. (also that they usually are not out of their jurisdiction). In John's case they are far enough apart to not interfere (AFAIK). But, from John's home location he can hear both.

Planners will never plan for scanners in system design.

If you had NAC validation and you want to hear both systems, just program both systems with their respective site NACs. That way you can monitor both or just one. They will also then be tagged correctly.

It's very much akin to monitoring a frequency without CTCSS/CDCSS ability. You will hear both users regardless of how the tag is programmed. With CTCSS/CDCSS, you can monitor either or both and the correct respective tags will show.

In other words, create your own favorites list in Sentinel by copying the desired system into a new favorite. Then add the correct NAC to that system since it's probably blank in the main database. Upload it to the scanner and disable (avoid) that system from the main database while adding your own favorites list to what's being scanned. This should take care of the problem with picking up the other system unless it's also being scanned due to its location/range circle covering your scanner's location. In that case you'll need to avoid that system too.

Except for the fact NAC is not supported for trunked Sites.
(that's the issue)

If it were, the main dB would work, too.

I get that but there is almost a certainty that some areas (because RF can't be fully tamed) of mutual interference (where both transmitters are equal signal strength); which the planners should consider. Perhaps that only happens outside both spheres of influence so it doesn't affect the system users.

I missed the location; but I presume it's high density so frequency sharing is required; similar to what my agency faced in the SF Bay Area, only so many choices per band while everyone demands more.

I will agree that RF knows no geopolitical boundaries, but these are geographically separated substantially, and there may not be mutual interference. Hopefully John will chime in with the details. I believe one is the Indianapolis system. I believe the other is a SAFE-T site in Indiana.

This may be one: <<https://www.radioreference.com/apps/db/?sid=5737>> and this may be the other <<https://www.radioreference.com/apps/db/?sid=8084>>

But, I see at least 3 duplicated control channels.

One example: 856.1625 is used on sites 1 and 2 of the respective systems above. That's around South Bend vs Indy which is around 150 miles separation. If that's too close, how far apart should frequencies be guarded?

My local new case remains to be seen if interference will occur, as the one site is very high profile. Those two are about 55 miles apart.

From: MCH
Topic: 5467 Message: 5492

Increase the programming efficiency (delete voice-only channels on P25 systems, use control-channel only on Motorola systems, etc.)

Make sure the HOLD TIME is set to 0 for all systems.

As far as picking up traffic faster, that will depend on the scan cycle, so by itself that is not an indication of speed.

The P2 series cannot hold as much programming info compared to the x36, so it will be able to process the lower amount of info faster.

The number of channels (talk groups) being scanned has absolutely no affect on trunked scan speed. The most common reason for perceived slow trunked scan speed is having too many sites enabled for scanning (the scanner will spend 1-2 seconds per enabled site).

There is no way to speed up trunked "scanning" of a site. The scanner must dwell on the site long enough to catch all channel grants/updates (i.e. 1-2 seconds).

The sites in question are separated by at least 15 miles from their alleged coverage areas. I think if the state did what others have by using 700MHZ as well this kind of thing could have been avoided. However Indiana seems to be holding off using those frequencies so they are limited in their choice of 800MHZ frequencies and they get constantly reused. To add to the issue they seem to reuse the same CC's over and over again adding more issues. The planning was done very poorly across both systems. In fact, originally the Indianapolis system was to have been a multi site system but due to Motorola issues costs went up and they made it a simulcast system without even asking the city. They did it so they could get the bonus money for getting the thing operational before the deadline on the bonus. They had issues with having enough frequencies for the multi site system so instead went the easy way out.

150 miles separation may be twice the minimum recommended but if John is smack dab in the middle that puts him 75 miles away from both systems... and well within range for problematic simulcast issues!

Not that it means much after all was said and done, if the state (or whatever agency charged with producing the ORIGINAL bid specs) was on top of what Motorola was up to, any changes would have had to be signed off on BEFORE Motorola went forward with changes to the system(s). I could venture a guess the state allowed Motorola to first propose a system and then create the specs. Speaking from first hand experience, the radio suppliers will be glad to build a system for you. And if you are not well versed in the field, and allow them to build and supply, you are at the mercy of whoever it is that is in the business of making money for THEIR company. There is nothing improper with this method, a system will be proposed that will do as you ask and contracts signed protecting the interests of both sides. But at what cost?

(Hopefully your system(s) that had (needed?) changes made were discussed BEFORE contract bid specs were changed. Changing contracts is illegal without the consent of both parties... but even if there was a violation of the contract, out-of-court settlements are reached. Yea, they were guilty but they made satisfactory amends.)

In my case I caught Motorola heavily influencing my town to go to a trunked system because (they said there were no longer any available frequencies to create a repeater system for the FD on either the VHF High or UHF bands.) Their attempt to convince the Town was basically a “lie of omission”. There were available frequencies if you knew where to look. I knew where to look. They did too but said nothing. This led to hiring a bonded, independent comms consultant who was charged with studying the town’s needs and recommending an alternate path. Motorola was not happy when I was asked by the town to sit in on the next meeting. They saw dollar signs by selling a multi million dollar trunked system and I called their bluff. We now have a VHF High band repeater System for the FD. Motorola built it but for a fraction of the cost of their proposed trunked system. (I’ve often thought about my speaking up which saved millions and receiving no recognition for it but when you look at the size of my town, you realize there is no one with any knowledge of comms systems. They even appointed a police captain to oversee the comms business who had no understanding of radio other than who to call when they needed repairs, that’s how the position was described to him... someone had to be in charge of making a call to radio repair! He was in charge only because they needed a full time employee to manage. But when I stopped in to talk, he embraced me as he admitted he was in over his head! And no one was ever the wiser about my involvement.

Hi
I am not new to scanning but new to this new computer firmware based scanning. I use the Sentinel system and have various results. I live near Philly and want to scan the PD and FD but my 536 has other plans. I load using the drop down menus but nothing. I get the same results with Trenton City, Camden City and the PA State Police. The only thing that seems to work is the NJ State Police and some of Burlington County. I have spent countless hours just getting to where I am now with this scanner. I am a retired State Trooper so I don't mind listening to my fellow Troopers but I want more out of this thing than that. Any help will be appreciated.

Be sure that you are running the latest database in your scanner and that the service types for the channels you want to monitor are enabled.
I am not sure what you mean by "I load using the drop down menus" as the scanner has no "drop down menus" and that doesn't seem applicable to Sentinel, either (it has menus at the top, but none are related to what you are doing).

I'd use Sentinel to move departments ISP District 12 (Effingham) Talkgroups and ISP District 13 (DuQuoin) Talkgroups into a new Favorites List (when you do that, it will also bring all the sites over into the Favorites List). Then, enable Location Control and turn on the service types for the channels you want to hear.
Write to Scanner, then put in your location (this will turn on only the sites relatively nearby).
I am assuming in the above that you live within 20 miles of both of the areas covered by District 12 and 13 (so that the location setting will turn those departments on, as well). Of course, if you don't, the sites near you won't be carrying their traffic, anyway.

Create a Favorites List and import the Sites used in your District. Then import the D-12 talkgroups,

Alternately you can lockout the unwanted talkgroups if you prefer using the full database.

Just because there is a site near you doesn't ensure that the site will carry traffic for those users. The site only carries traffic for users who's radios have affiliated with that site. If there are no District 12 units in the area that have radios affiliated with that site, the site won't carry their radio traffic.

My 536 and 436 have no problem with the ISP when you use the zip code, just was trying to avoid District 11 at Maryville (Metro-East from StL).

5508. Question on improving Project 25 Phase 1 reception

Yahoo group: BCD536HP
Date: 2018-03-14 13:10:47 UTC
From: jg1067@...
Topic: 5508 Message: 5508

Quick question for the group -- I am trying to monitor the Peoria, IL. City Police using their fairly new Peoria County Illinois ETSB (P25 Phase 1) system on my 536. Sometimes (maybe 15-20% of the time) the audio sounds very loud and clear with no dropouts in audio, while the other 80-85% of the time it sounds choppy, distorted and missing part of the conversation (it drops out) or sometimes misses entire transmissions altogether.. I am trying to monitor this system in a city about 15 miles away from Peoria. I was looking at Radio Reference researching their repeaters for the system and found one listed for Mapleton, IL. which would be the closest repeater to me and literally 5 miles away as the crow flies. I suspect that perhaps when I get a good strong transmission, it might be coming from that repeater. If so, is there any way I can tell my scanner to only get transmissions from this one repeater in Mapleton (the closest repeater) and not the others (I think there are 7 repeaters total -- some of the furthest which are 35 miles away from me)?

When this system was analog only about 3 years ago, I could monitor their system without issue, but now that they've gone digital, I usually see high error rates and I've tried adjusting the P25 threshold and trying to make adjustments to the P25 settings in the scanner, but with no luck. I've set the P25 threshold settings back to "Auto" again, since it didn't seem to make much difference.

Does anyone have any suggestions? I am using this scanner inside my home using the stock 536 antenna using the latest firmware available. I have priority turned off and not trying to monitor other systems when trying to listen to the Peoria County P25 Phase 1 system -- the scanner is set to only try and monitor this single system.

Thanks for any help or suggestions.

According to RadioReference information:

The system that is being built will be an 800 MHz Harris P25 Simulcast system consisting of 11 transmitter sites throughout the county.
(Unofficial name - COPURS - County Of Peoria Unified Radio System)

Construction has already begun on some of the sites, with most sites starting to be built during Spring 2013.
The plan is for the new system to undergo testing late Summer/early Fall 2013, with the first agencies cutting over toward the beginning of 2014.
The county has a narrowband wavier in place until June 30, 2014.
Most public safety agencies in the county will eventually migrate to this system.

Site 1: 3615 North Grandview Drive - Peoria -- Grandview Park
Site 2: 922 North Glenwood - Peoria -- Bradley Universcity
Site 3: 301 North Maxwell Road - Peoria -- Jail
Site 4: 19121 North Perry Street - Princeville
Site 5: 1828 West Cloverdale Road - Chillicothe
Site 6: 6035 North Knoxville Avenue - Peoria
Site 7: 7903 S HURST DR - Peoria
Site 8: 8826 WEST ROUTE 24 - MAPLETON -- UAW
Site 9: 10321 CIVIL DEFENSE RD - BRIMFIELD -- EOC Of Peoria County
Site 10: 15017 N EVANS MILL RD - PRINCEVILLE
Site 11: 10628 N GALENA RD - MOSSVILLE -- Storage Business

Wil be rolled out as P25 Phase I, but may be switched to Phase II in the future.

So what this all means is that the exact same frequencies are being used simultaneously throughout the 11 transmitter sites. So you cannot block out one or more sites since they're all using the exact same frequencies broadcasting at the same time (but not always all at once). Your best bet for blocking out other sites would be to use a directional antenna to try to ensure you're getting the best signal from only one site at a time.

However, just because they're "simulcast" doesn't mean every site transmits at the same time. Usually, only those sites which have client radios affiliated with that site will cause a particular site to become active when that radio has utilized that site by coming into range of it and "pinging" it. So there is no guarantee that picking up the closest site will get you what you want to hear.

The symptom of hearing only half the conversation is often caused by this operating characteristic. Dispatch may be programmed to light up all 11 sites but only the 2 or 3 sites which hear the response from the patrol car answering will continue to carry the conversation while the others outside the range of the patrol car's radio remain dark. If the transmission was destined for a particular area's talkgroup, it may only go out on 3 or 4 sites rather than system-wide; and the responses might be carried by only those 3 or 4

sites which could be beyond your receiver's capabilities to detect.

It's a conundrum for sure. Do you want to hear all 11 sites or will doing that cause simulcast distortion to wipe out any chance of getting clear communication from so many at once? If you receive only 1 site, it will be clear but may not carry the conversation you wish to receive. The only (relatively) sure solution is to move to within the coverage area of the sites which have the communications you wish to hear. That's not a GOOD solution though...

I'd try the directional 800 MHz Yagi antenna on a pole pointed in the general direction of the entire system first. Adjust it's pointing direction till you're satisfied with it.

I am 92.368% certain that, in a simulcast system, all towers part of a simulcast site carry the same traffic all the time. Affiliation with a particular tower is not required. Affiliation with any tower part of the simulcast site activates the traffic for all towers that are part of that simulcast site.
However, the behavior you describe is dead-on for multisite systems.

I’m assuming your question relates to a base monitoring setup, and not a mobile.Try locking out all other sites but the closest and see what results you get... if that doesn’t work, do the same but with a different site, and so on until you fall on the one site that works for you all the time. Logically speaking, the site that’s only 5 miles down the road would be the best choice... But, it may not be due to other variables, such as antenna orientation or power constraints, to name a couple of reasons.

UPMan is correct. with simulcast system, affiliation does not affect the number of sites being lit up. They are all going to be transmitting.

My suggestion for the OP is to lay out all the sites on a map with respect to his home. Determine the direction that will have FEWEST sites or fewest with least time (distance miles time 5.4 microseconds) differential between them and try a 9 dB or better gain Yagi antenna and point it that direction.

5521. What's the secret to CLEAR audio?

Yahoo group: BCD536HP
Date: 2018-04-04 18:24:53 UTC
From: mrjeff99@...
Topic: 5521 Message: 5521

I just bought a new BCD536 and the audio sounds like it's going through a "salad shooter" before you hear it. Simply awful!. I've have set it up both by zipcode and choosing what I want from the State DB. A scanner enthusiast friend that owns the 436 has taken a turn at fine tuning with no improvement. I've tried the stock antenna, a discone made of 1/4" mesh hardware cloth designed for 240mHz to 1.2gHz and a cheap little VHF/UHF dipole with no difference. I've looked at error rates in all P25 levels (5 to 13) and they were generally similar (25-116). I live in an area of Va. with rolling hills and small mountains surrounding the county I monitor. Surely this scanner can do better, so, what's the damn secret?

Sometimes when that occurs it's actually simple to fix. Copy the SD card to your hard drive and then format the card using SDFormat and reinstall the card copy from the hard drive to the SD card.

All data that controls the scanner should be good after that.

Yes, you should never use anything but SDFormat for SD cards used in scanners. I forget the exact mode but believe it's FAT16. Been a while since I have needed to do it lol.

Phase II is backwards compatible in regards to being able to run Phase I also. So a current Phase I System can be brought up to a Phase II by adding a few Phase II radios at a time. Nice if you don’t like large capitol outlays.

Sorry for the lack of info. I'm listening to a apco phase 2 system in Bedford County, Va. It's listed under Region 2000, Central Va. Radio Communications. I wish to monitor the County Sheriff, Town Police and Fire dept. After updating my scanner firmware and Master database I used Sentinel to select the systems I wanted. They scan and pause when there's some traffic and emit the "salad shooter" audio. My attempts to refine reception were listed in my previous post. Jeff KJ4RWH

I don't have many systems I listen to, but it appears my 536 has gone

deaf on 700/800. No changes made (except installed NXDN but that was a

few weeks ago). Stopped receiving the 700/800 P25 systems I listen to.

Have confirmed with other people listening to the same system no

changes made. Tried 2 antennas. Can pick up VHF NOAA frequencies fine.

Strong system. Any ideas / suggestions? Tried clear user data,

reinstalled complete full database.... No go :(

Yes. I find the audio a bit hard to hear in the car. I am not faulting the scanner, cause I’m a bit deaf. I plug it into a powered speaker and I am fine. Someone should make a long life battery (i.e. AA Enloop) powered speaker made just for scanners. I bet it would sell good.

I also got mine modded up with an internal GPS, and I am extremely happy with it. I travel a lot, and just landing from a plane, getting into the rental car, and turning it on and it working is great (without all the cables and power worries). Another thing I am perplexed why Uniden doesn’t incorporate into a hand held scanner!

I see the new 101 scanner is gong to be in color! That will me excellent, but I’m not going to upgrade from my 486 for it! :(

Otherwise I’m a happy guy.

When you updated the system did you append the new info to your Favorites list before sending it to the scanner?

I don't know how old or used your scanner is, but you could try copying the SD card to your hard drive. Then format the card with SDFormat from sdformat.com (http://sdformat.com) or .org I forget. Once formatted copy the SD card info back on to the card and see if that helps. Sometimes over time the data gets corrupt and reformat fixes the issue of no reception.

The images are blocked due to the List settings. It appears that you need to update the driver for the 436 Serial port. Right click on the item in Device Manager and select Update Driver. Let Windows search out the correct driver.

5538. Trouble with Favorites List

Yahoo group: BCD536HP
Date: 2018-04-22 03:48:20 UTC
From: KR5TX@...
Topic: 5538 Message: 5538

New to the Uniden BCD536HP and have a programming issue.

I can receive our Lubbock City-County Project 25 Phase II Mutual Radio System off of the National Database that downloads to the radio. However, when I try to copy that system to a favorites list the radio will not receive and lock on to signals on that system. I can however receive other agencies.

Does anybody have any ideas as to how to make this work?

THANKS IN ADVANCE

This doesn't sound like a ProScan issue so may not have much to offer. I would make sure the scanner is in Serial Port mode. Also check the correct driver is loaded.

This page has the link to the serial port driver.

5540. ISP STARCOM Issue

Yahoo group: BCD536HP
Date: 2018-04-17 14:32:51 UTC
From: Tim Ferguson
Topic: 5540 Message: 5540

I was hoping to add the Illinois State Police to a FL that I created just for the ISP, but am having trouble getting audio. The ISP uses a STARCOM 21 system, and I've added the entire ISP list from RR using Sentinel to the ISP FL, and the scanner shows it scanning those channels and occasionally stopping, but no audio. Any ideas or suggestions would be appreciated.

As an added note, if I use the basic Zip Code programming method, ISP works fine and I get all transmission with no problem

Thanks,
Tim

5551. Sm card importance??? where to get one, and computer cable ?

Yahoo group: BCD536HP
Date: 2018-04-29 21:16:43 UTC
From: lylemains1@...
Topic: 5551 Message: 5551

I just bought the BCD 536HP scanner, used, and it didn't have any cables or SM card to it. I read something about wifi??? If, I need a SM card, where to get one, and also a cable, to "update"(?) Another question, is that I am totally new to the new trunking scanning monitoring, and am wondering how to get all the talk channels, from a certain group, like the Tyler PD, Smith County Sheriff and ETMC ambulance service. Any help there would also be muchly appreciated!

Get a MicroSD card pretty much anywhere. Using Sentinel, select "Clear User Data", check "Show All Drives" in the window, then select the SD Card and accept.
Easiest way to program is using Sentinel (or just enter your zip code once you make a card for it).
As for cable, it uses a standard USB Mini.

Google the owners manual for where to get the cable and correct size SD card... plus I’m sure there will be other responses that better help you...

As for gathering programming data, it’s a chore to program manually but the radio allows for the use of free programming software called Sentinel. It’s available online. It allows for programming what you want easily.

What state are you in?

Bill

Like Paul said you can used any Micro SD Card and the free Sentinel software to set it up.

If you don't have a computer or the skills needed to do it you can buy a pre-programmed SD Card from ScannerMaster. It ain't cheap but it will include the latest firmware, database and a Favorites List for your home area.

Anybody buy or know of somebody who bought Scanner Master’s (or for that matter, ANYONE ELSE who offers this service for a fee) pre-programmed SD cards? I’ve learned there are many out there that are helping out in that regard for free. I’ve done it for friends... I’ve gotten code plugs from ham friends for my DMR rigs for no charge and figure my programming SD cards for free is simply my passing the favor forward.

There really is no "correct size". The stock cars was 4 GB (too small
for the advanced user). Use as large of one as you can. The specs say up
to 32 GB, but I've been using a 64GB card for years.

4 GB may be fine if you don't plan on using the RECORD feature, but it
will fill up FAST.

I still have a 4 GB card, though I replaced it about a year ago as the first card got corrupted somehow. I think I have a LOT programmed in, and it shows only 4% used. So I don’t think I need a 32 GB card. I don’t record at all, unless I hit the button by accident.

According to Radio Reference, Smith County, Texas is on a statewide trunked system. It’s a large system and as such, has many sites. I’d advise loading only those sites local to you. Otherwise, I suspect the scanner would take too long to move through all the sites and cause you to miss calls? There’s no sense making the scanner check for TG’s that are out of range.Discuss

Unless you are recording you can use a small capacity card. I have a 2GB in my 536 that has been chugging along for 3 years.

The database and a few dozen Favorites List only take up a small amount of room, perhaps half a GB or so. It is recordings that take up a lot of room and if you have that turned off to will not need a larger card plus it is less likely that you would corrupt the card by pulling power while the radio is on (such as having the radio vehicle mounted and connected to the ignition.)

The following BCD536HP poll is now closed. Here are the
final results

This is a poll to evaluate the scanner's automatic setup via the database and zipcode selection. We're looking at your satisfaction with Agencies and Departments found along with the audio quality.
Created by: jeffreyclay

1. Yes, it was very complete.
https://groups.yahoo.com/neo/groups/BCD536HP/polls/poll/9395598#40870019 69.23%(9)
2. Not so much, I will have to fine tune some.
https://groups.yahoo.com/neo/groups/BCD536HP/polls/poll/9395598#40870001 7.69%(1)
3. It found things but I can't understand any of it, sounds like a $5 cell phone.
https://groups.yahoo.com/neo/groups/BCD536HP/polls/poll/9395598#40870020 23.08%(3)

Tyler. Smith County, as well as Longview, are on the sizable TxWARN P25 system.
https://www.radioreference.com/apps/db/?sid=4563
https://www.radioreference.com/apps/db/?sid=4563
While it's not a true statewide trunking system (there are none in Texas for public safety), it is quite large, especially down in the Houston/Harris County metro area.

Texas DPS also has talkgroups for the Tyler area on the system. Occasionally, I hear them on the Kaufman site in TxWARN. (I'm in Dallas).

Canton, to your west in Van Zandt County, has also put their own https://www.radioreference.com/apps/db/?sid=9547 P25 system in service. Van Zandt County itself is still conventional, though EMS coverage is on TxWARN for the portions of the county that East Texas Medical Center provides the service; other parts of the county are served by a different EMS provider, which is on another system https://www.radioreference.com/apps/db/?sid=7261.

There are several sites in Smith County: a Tyler Simulcast, plus 4 others. I would suggest that you include all of them.

If you need more specific help in creating a favorites list for your area, contact me off list.

Use SDFormat from SDFormat.org (http://SDFormat.org)

Sent from my Verizon Motorola Droid
On May 3, 2018 11:14 AM, "'BCD 536HP1' bcd536hp1@yahoo.com [BCD536HP]" <BCD536HP@yahoogroups.com> wrote:

Evidently my Micro SD card has failed in my BCD536HP scanner.
Using Sentinel, select "Clear User Data", check "Show All Drives" in the window there is nothing there.

How do you format the NEW SD Card so I can write my favorites to it?

Thank you.

I believe I’ve asked this before, but, do the power companies do something on their electric lines that would cause interference on a scanner, especially in the summer? I have a Bearcat BCT15X sitting next to my BCD536HP and it has once again started picking up random “broadcasts” which sound like electrical interference (static) that last anywhere from 5 to 15 seconds. The other day it was on 151.22000 and I eventually had to lock it out. Today it is on 155.07000 and I’m able to lock it out temporarily. I’ve unlocked 151.22000 and it appears to be OK today.

Since the BCD536HP is not doing this, I’m wondering about the difference between the two and how and if the BCT15X can be programmed to avoid these random “transmissions” as well? They are rather annoying and louder than regular traffic.

When running SDFormat, READ THE SCREEN and insure you're formatting your SD card and not your hard drive (C:\). Note the name your computer has given the SD card (E:\, G:\, H:\, etc). Be super careful you don't reformat your hard drive... it's easy to do if you rush and click without watching!

I see an email that says a new file has been uploaded.

I click onto that link Okay I log into my http://groups.yahoo.com

I see Conversations, Photos, Files at the top, I can click on Conversations and see those.

I can Clink on Photos nothing.

Then I click on Files but nothing happens! Just a hand with a little blue circle.

And when I type into blank search area and type in search files it says

“ Oops:

You need to be a member to perform this action”

Well I am a MEMBER!!

Thank You,

Ray Ray

Where (state, county, city) are you?

Chances are it's a digital communications mode that your BCT15X doesn't know how to decode. It simply sounds off with the actual buzzes and squawks of the digital signal. Your much smarter BCD536HP knows it's not a format that you should be receiving so stays quiet.

A lot of things can cause interference. But the most likely cause since it happens when it's summer is the leaves deflecting signals that are causing it. Do you realize how much RF is around you constantly 25/7/365?

Anything electrical can cause noise too. Even light bulbs have a small amount of RF, some more than others. I had some that actually said on them they caused noise in the HF spectrum.

5584. NEED SERIOUS HELP ON THE BCD536HP

Yahoo group: BCD536HP
Date: 2018-05-19 19:12:41 UTC
From: Thomas Vance
Topic: 5584 Message: 5584

I need some serious help.

I thought my SD Card had failed. So I purchased a new Micro SD Card 16GB.

The message I was receiving was SD Card File Error, Use Sentinel "Clear User Data" So under Scanner I clicked on Clear User Data and a box popped open

Select microSD nothing showed up. So I clicked display all drives and refresh and still nothing showed up.

I installed the new SD Card and the same thing with the same Use Sentinel "Clear User Data" message shows up.

Please tell me what I am doing wrong,

OR HAS MY NEW SCANNER GONE BAD?????

Thanks To All Who Reply!!!

Thomas

Points of fault could be the USB cable, the USB connector on the PC or scanner, and the SD card mount.

Joe,

When I bought the scanner a few moths back I had them to program it for (1) County. That was stupid!!!!! Wasted $$$$$$$$

Everything worked fine. I cut it off and went to turn it on the next morning and that is when it gave me the message on the scanner screen,

SD Card File Error, Use Sentinel “Clear User Data” I tried to clear User Data but it did not show up in the drives.

So I purchased a new Micro SD card and still get the same message.

I guess next I will do what Paul Suggested and try a new USB to Mini cable and see if that is the problem.?

Thanks’

Thomas

Paul O. & Joe M.,

Got a new cable and the same thing happens.

SD Card File Error, Use Sentinel “Clear User Data”

What next please?

Thanks’

Do you have a Micro SD card reader you can use to perform the clear?

Topic: 5584 Message: 5597

Joe M. Thanks!

I went to wally world and purchased one. Done the job. But there is a story behind this.

When I got through formatting the card I forgot to put it into the scanner. I turned the power on and NOTHING. No Power.

I was in process of boxing it up to return it to where I had purchased it from and noticed there was 2 Micro Cards on my desk.

I pulled the scanner out of the box, hooked it all back up, stuck in the SD card and it powered on.

I wish it had been mentioned in the Group somewhere since this scanner came out that the Micro SD Card had to be in the scanner

In order for it to power up.

Thanks'

Thomas

5599. Help on Firmware Update

Yahoo group: BCD536HP
Date: 2018-05-26 16:29:18 UTC
From: Thomas Vance
Topic: 5599 Message: 5599

Please, I need some home on the Firmware update for the BCD536HP.

Where is the link that works?

I sign into my email SCANNER1143 AND THEN MY PASSWORD,

Look under files and it will not let me do anything.

Just a little hand with a blue circle.

Thanks In Advance

Thomas

I see there has been NEW FILES uploaded to the BCD536HP Group.

When I log into my yahoo email account it will not let me click on files.

If I type in BCD536HP files

It says I have to be a member of this group. I am a member of this group.

What is going on or what am I doing wrong?

Thomas

From: Chuck Santose
Topic: 5584 Message: 5601

As I recall there are 2 choices when connecting the USB cable to the radio. "." and "E". Selecting E, USB Mass Storage, is the correct choice.

The radio shows as a "removable storage device" on my PC -- several of them.

The version of Sentinel I have is 1.07 (Revision 05). You using that version?

Micro SD Card is formatted as FAT32 in my receiver. Mine is 32G so I doubt it came with the radio. It's also 99% empty so that much RAM is not necessary.

From the documentation:

Reformatting the microSD Card
Reformat microSD cards using a special SD Card Formatter (https://www
..sdcard.org/downloads/
formatter_4/). Then, you need to “Clear User Data” using Sentinel to restore all HP files and
directories to the card.
After formatting, the HP won’t be automatically detected (since it is wiped clean), so you may need
to uncheck “Hide empty drives” in windows “Tools>Folder Options>View before doing the “Clear
User Data” step.

Run Sentinel, then select UPDATE, then UPDATE FIRMWARE.

That is the official way.

Press AVOID once for Temporary Avoid, and press it twice for
Permanent Avoid. Temporary only avoids until the next power cycle.

From: Thomas Vance
Topic: 5599 Message: 5606

Thanks Joe M.

Had to put it in Mass Storage , But it worked just as you said..

I have only had these scanner a couple of months and it is even a whole lot harder for me to learn than all my prior Uniden scanners.

And I have a wall full of them.

So with this being said I apologize for asking for so much help.

This firmware update must have been talked about before I joined the group. For this I apologize also.

Thank Joe M.

Thomas

5618. HELP UNDERSTANDING THE KEYS

Yahoo group: BCD536HP
Date: 2018-06-23 16:39:47 UTC
From: Thomas Vance
Topic: 5618 Message: 5618

Thank you in advance for any help.

ON the BCD536HP

Say I had 4 sites and I wanted to assign one of the numbers on the front panel of the scanner a number.

Would that be Under Each Site and the QUICK KEY?

Or

Would that be under Each DEPARTMENT?

And how do you lock 1 out and then unlock it.

Thomas

Again, Thank you for your time and help!!!!!!!!!

You would assign each Site a quick Key which would be under the System
which is under the FL. The use would be:

FLQK.SQK.SiteQK

If you are scanning only that system, you can use the shortcut ..SiteQK

Uniden supplies programming software (for free) called Sentinel. Aside from programming, Sentinel is also how you get firmware updates from Uniden. ARC does not do this. (But it does other things that Sentinel doesn’t do.)

I suggest first you get familiar with Sentinel. Then look at ARC536PRO.

A couple of things you should know... Both programs (Sentinel and ARC536PRO) are stand-alone programs... you do not need one to use the other. They both run independently of the other. Updating the database is free with Sentinel but not with ARC536PRO if you intend on downloading directly into the scanner’s memory you have to pay Butel for the ARC program and additionally, subscribe to Radioreference.com.

I have all my stuff set up into FLs with one QK consecutive QK to them all so that I turn on and off each list I want to monitor just like I would banks on older scanners. I put the number in front of the list name when doing alpha-tagging and make them all consecutive - local PD on 1, sheriff on 2, fire on 3, EMTs on 4, federal on 5, FRS/GMRS on 6 and so on and so forth. Then I just key in what I want and turn off what I want. Works like a charm and is not so confusing. I typed up a little cheat sheet taped to the wall with the numbered lists on it. Not unless the state police Starcom21 system is a simulcast system. Not sure what that is unless it means operating on the same frequencies from different towers?

5627. RE: [BCD536HP] Butel Pro software

Yahoo group: BCD536HP
Date: 2018-06-27 22:51:56 UTC
From: Rich
Topic: 5621 Message: 5627

Dean,

A learning curve is subjective…how sharp or soft the curve is largely depends on you, how you learn and how much experience you have with PCs, software, windows, etc. I have the BCD 536 and use the Butel software to progam it. Previous to buying the 536 I had been using the Radio Shack line of digital scanners…the Pro 197 and Pro 106. so the biggest issue I had was learning the architecture of the Uniden receiver as there is enough difference between how these radios function and are programmed…'Favorites' vs 'Scan Lists' for example. once I wrapped my head around how to organize the programming in my 536 vs how I did it in the Pro-197 the rest was easy and that includes using the Butel software.

I would suggest ProScan instead. Better user interface, more radio-like. Buy one license and use it on 2 computers and for unlimited amount of Uniden scanners. Butel charges for each scanner and there is zippo for customer service. I bought ARC500 for my Whistler 1065 and the virtual display never worked - they offered no tech support and did not offer to refund me. Very rude guy. I would never buy from them again. ProScan has the best customer service, Bob goes beyond the call of duty, and it is an American company. There is a learning curve to every software program for radios, just like there is for every new radio. Once you get it, you got it.

I would go with the SDS100. Yeah it's a pretty penny for a scanner but it does it all and much better than it's predecessors. I am buying one and getting all the paid upgrades (DMR/NXDN/ProVoice) but thru Uniden (much more affordable) . I have played with one for about 2 hours and was mightily impressed. My 536 struggles with simulcast here on the Ohio MARCS system and the sds whizzed right along without missing any transmissions, not cutting out, not garbled, very clear with good audio. Just my 2-cents

And more specifically your familiarity with SW made by the same author.

If you know ARC780, ARC-Patrol would be much easier than it would be for someone with no ARC experience.

That's my biggest beef with "this SW su**s" complaints. That can be said of ANY SW (bar NONE) if you only know a competitor's SW.

I recall when I first saw Motorola SW in the 80s. I was familiar with GE. Naturally, it was a PITA to use Motorola SW at first. That does not mean it su**ed. That meant it was different. Then the same was the case with nearly each new manufacturer. About the only exception I can think of is Winxx/PSRedit which are written very similarly to each other.

The language/translation barrier doesn't help with SW that when it reads radios says "now data reading". I think that was Kenwood that did that, but it might have been someone else.

Point being - anything different will be harder than what you know.
That does not mean it 'su**s' - only that it's different.

...or wait for the SDS200 or SDS500?

Someone posted they had it on good authority a desk/mobile version is in the works. The “SDS200” is how all are referring to the desk/mobile but when I saw the referral to another version, (he is calling it the “SDS500”) I asked about this possible third version. His answer-a touch screen display! All well and good but if (and that’s a big if) it is not vaporware, it’s going to need a bigger display. Personally, a Bluetooth connection and an app that allows for fully controlling the scanner remotely, using an existing iPad or similar device would seem the logical way to go.

I may be guilty of spreading a nasty rumor, the SDS500, not wanting to add any credibility to the post (as I did not start the rumor-if it is a rumor). But it sure would be nice to have the a larger screen for both inter-active programming and monitoring.

Certainly Uniden would be releasing a mobile version of the SDS100.
But I have not heard as yet that there is more than one unit coming.

Is there an easy “one-step-at-a-time” “Quick Keys For Dummies” method, for old folks like me? I have more than 50 FLs in my two scanners and I’m tired of going through them, manually, and turning these “off” and those “on”, and then back again. I’d much rather just hit 0-5-2 or whatever the sequence is to activate or deactivate the ones I’m interested in at the moment.

So, yes, I’m a “dummy” and I need some help.

They have not released the revised/improved battery yet.

The currently battery gives about 5.5 hours.

You can charge and listen at the same time.

If there are some that are always used together you can combine them
into one FLQK. (provided your FL is not at the 1 MB limit)

FirstNet is a data and voice system for first responders that is effectively a private cellular data & voice system for Public Safety. While not really intended to replace standard two-way radio systems (right away anyway) it might eventually if it gets fully built out.

The legislation that created FirstNet also included the removal of the UHF-T Band (470-512 MHz.) from Public Safety use to be auctioned off and provide funding for FirstNet but it looks like that part may not happen.

It is likely that the system will be mostly available in the large metro areas first and rural areas last, if ever.

I got the Sentinel loaded onto the computer, and it couldn't find the driver (with programing cable and SD card in place). I unhooked the program cable, and went to turn the unit on, NOTHING! On the screen, it said that "power cord access error" I need help!

I figured, I'd mess the radio up, trying to update, and configure the TXWRN freq for Smith County. Evidently too much of a learning curve, for this old fart!

5646. "NOTHING TO SCAN" I need some help!!!

From: kstrsdn@...
Topic: 5646 Message: 5646

I have been spending hours to get the scanner to work properly with Favorites. I have had this scanner for a while and had favorites initialize every time I turned it on. I had set it up a long time ago but when I did a firmware update it wiped everything out. I tried to write to scanner with my favorites from Sentinel. After I did that the scanner said nothing to scan. I did have favorites selected. Prior to this I had it set up so I did not have to use quick keys.I hope someone can help me. I have read the manual and the Nifty manual witout any luck. I am frustrated because I have an SDS100 coming tomorrow anthat wanted to update my Sentinel so I could duplicate what I have on my 536.

73,
Dean

“Nothing to Scan" Checklist BCDx36HP

Scanner Checklist:
1. A location has to be set in 'Set Your Location' to monitor the Database.
2. You must enable at least one Favorites List or the Full Database in 'Set Scan Selection>Select Lists to Monitor'.
3. Favorites Lists or Systems with QK's assigned to them must be enabled with QK's or in 'Set Scan Selection>Manage Quick Key Status'.
4. Make sure 'ID Search' is On for the system if no IDs are programmed.
5. Service Types for the channels you want to monitor must be set to On.
6. Any FL with 'Use Location Control' set to On must have locations programmed for the Departments and/or Sites.

If you are programming everything in Sentinel first and sending it to the scanner:

Edit Profile>Scan Selection tab: Make sure 'Monitor' and 'Download' are On for FL's you want to scan.
Check or uncheck 'Monitor Full Database'.
Edit Profile>Service Types tab: Make sure the Service Types you want to monitor are checked.
Custom 1 is needed for miscellaneous channels.
Edit Profile>Location Settings tab: Make sure you have a location programmed for scanning the Full Database or FL's with 'Use Location Control' set to On.
Edit Profile>Quick Key Status tab: Make sure FLQK's are checked for FL's you want to monitor.
Edit Favorites List>System QK Status tab: Make sure SQK's are checked for systems you want to monitor.
Edit Favorites List>System>Options tab: Make sure 'ID Search' is On if no IDs are programmed.
Edit Favorites List>System>Dept/Site Quick Keys Status tab: Make sure Department/Site QK's are checked for departments/sites you want to monitor.
Edit Favorites List>System>Dept/Site>Location tab: Make sure Departments/Sites have locations programmed if 'Use Location Control' is set to On for the FL.

Stephen,

I’m not all that familiar with FIRSTNET but I am familiar with how the Federal Government works and the intended removal of the UHF-T Band is disturbing.

You wrote; “The legislation that created FirstNet also included the removal of the UHF-T Band (470-512 MHz.) from Public Safety use to be auctioned off and provide funding for FirstNet but it looks like that part may not happen.”

And although it looks like they have backed off of that idea, make no mistake, they probably decided to wait (the many? years it will take) for a natural migration to FIRSTNET (IF it grows as expected). That way, they are not forcing agencies to scrap their present UHF comms systems and incur the expense of a new system. Unless they are offering incentives to defray these costs by offering to pay for a move to FIRSTNET, which looks likely from what you wrote (and provide funding for FIRSTNET). It looks like all bets are off!

I don't know how many public safety agencies operate between 470-512 MHz but what’s next? Additional chunks of the band?

In any case, the handwriting is on the wall... I’d be VERY leery of pouring money into improvements to a current UHF system or buying a new UHF system.

It’s how the Feds work... they first propose, then legislate knowing they will get pushback. And then amend the original order to allow for extensions. All in an effort to make all aware of their original intentions. Which is to auction off the UHF-T Band.

Who among us doesn’t believe the Feds haven’t already “factored in” and spent the money they project they will get from this auction? Nope, the Feds haven’t dropped their intention of auctioning off the UHF-T Band, backing off is just part of the plan.

I think I will be watching what MOTOROLA does with their land mobile product offerings and how fast they produce/support FIRSTNET products... that could be a good indicator of how fast FIRSTNET snowballs... and unfortunately, how fast the scanner market goes away.

One man’s opinion,

Bill

hello group this also might be off topic but are there
any groups for the whistler scanners. i am signed up
for one but i have not seen any activity there for a
long time. i like to read about all of the different makes
and models of scanners.thank you
Leonard

I would be interested in all that too.

Yesterday, I thought I would look to see what Groups.io
had to offer. (Some Yahoo Groups are converting to
Groups.io)

https://groups.io/search?q=whistler

There are three Whistler groups there. The total membership
of the three groups is eleven and no one is talking. Oh well.

Check in the menu for selected service types, you may have them all turned off (nothing to scan). It'll say aircraft, law dispatch, law talk, etc...)

Hiya Dean -
This new breed of scanners definitely throws a learning curve at us old folks, huh? I pulled my hair out trying to coordinate and program 3 different digital scanners - the bcd536hp, ws-1065, and the trx-1 - before I came up with a proven easy method. I cannot claim ownership to this method, as I learned it from a guy named pinballwhiz86 on the radioreference.com website, but that doesn't mean I can't pass it along, right? I did this on all three digital scanners and it works like a charm.
First of all, the instructions sent to you by bill Nolan? Write those down! Important reminder when you get a 'Nothing To Scan' message!
I hope I can explain this coherently...I am taking for granted you know how to do the sites/systems import from rr.com. I live in Fairborn, OH, in Greene County, right next to Dayton which is Montgomery County. So, I start my FLs (Favorite Lists) alpha-tags with consecutive numbers before the actual name, for me it was the City of Fairborn PD - I named it (1) Fairborn PD...then Greene County which I named (2) Greene County...then (3) Dayton, (4) Montgomery County and so on. Always with the number before the name. Helps you keep track when quickly navigating your FLs. Don't worry about channels and systems and departments and all that, it's too confusing that way...dump all of your imported systems/sites into a couple of massive FLs (number them 98-99) and then go into THEM and assign TGs to your numbered and named FLs (append to FL).. That way, you can go thru your scanner and turn on and turn off all of your numbered and named FLs just like you would turn off and on all of your banks on an older scanner. Make sense? Make your home police #1...Fire #2...EMTs #3...County Sheriff #4...etc..etc....I have 99 FLs numbered that way with a cheat sheet taped by the scanner and I can fly thru there and listen to whatever I want as quickly as I want to on all 3 digital scanners.
Enable ALL of your service types. There you have it. If I can help you out in any way, email me direct kf4anc@... - ok!
I, too, have SDS100 coming soon, and I am putting the same system into it that is in my bcd536hp - in Sentinel just copy profile, change the name, target to sds100 in Sentinel and write to scanner. Digital scanning made easy!
Hope this helps you out some
JDkf4anc

5663. Am I missing the obvious way to alpha tag?

Yahoo group: BCD536HP
Date: 2018-07-16 03:15:46 UTC
From: Evan Platt
Topic: 5663 Message: 5663

So doing a data dump from basically a FCC dump. new listings, etc.

they're digital, so I add a DMR one frequency system for example.
I add a department - "Unknown"
Add a site - say "VHF - Corporate".
In there, I just have the option to add a "Channel" with a frequency,
and color code search.

So the problem is my logger - proscan. So I have it log the details,
but without the frequency, it's useless, the filename just says say TG
301 ID 12.

If I add frequency to the radio logging format, then I get the
frequency even on recordings for trunked systems, which is useless.

Am I missing the way to say add the frequency as a alpha tag?

Not sure if ProScan logs site name, but if it does, name each site with the freq it contains.
DMR OFT is the correct type for one-frequency DMR systems.

I understand that, was hoping there's a way to add alpha tags. I think I'm stuck with how Proscan handles it :(

I was contacted via email by the OP.

I advised to use the format specifier %FT in the Recording file names and not %F. %FT will display frequencies on conventional systems and TGID on trunking systems.

Topic: 5671 Message: 5671

First off, I want to thank everyone who sent me directions on how to make the 536 scan my favorites list. I must be thick headed or my brain is melting down because I just cant scan my favorites. I have my favorites list on Sentinel and am successful in writing them to the 536. My favorite list is called FAVORITES and appears like that when I go to Lists to Scan on the 536. When I turn everything off except Favorite to scan, "Nothing to Scan " appears. I only have 1 list to scan and it is called FAVORITES. All I want to accomplish is when I turn the scanner on, I just want to scan my favorites and that's all. I think the quick keys, startup keys etc. are confusing me. If someone could walk me through my requirement in layman's terms, it would be greatly appreciated. I am sorry to be such a pain.

“Nothing to Scan" Checklist BCDx36HP

Scanner Checklist:
1. A location has to be set in 'Set Your Location' to monitor the Database.
2. You must enable at least one Favorites List or the Full Database in 'Set Scan Selection>Select Lists to Monitor'.
3. Favorites Lists or Systems with QK's assigned to them must be enabled with QK's or in 'Set Scan Selection>Manage Quick Key Status'.
4. Make sure 'ID Search' is On for the system if no IDs are programmed.
5. Service Types for the channels you want to monitor must be set to On.
6. Any FL with 'Use Location Control' set to On must have locations programmed for the Departments and/or Sites.

If you are programming everything in Sentinel first and sending it to the scanner:

Edit Profile>Scan Selection tab: Make sure 'Monitor' and 'Download' are On for FL's you want to scan.
Check or uncheck 'Monitor Full Database'.
Edit Profile>Service Types tab: Make sure the Service Types you want to monitor are checked.
Custom 1 is needed for miscellaneous channels.
Edit Profile>Location Settings tab: Make sure you have a location programmed for scanning the Full Database or FL's with 'Use Location Control' set to On.
Edit Profile>Quick Key Status tab: Make sure FLQK's are checked for FL's you want to monitor.
Edit Favorites List>System QK Status tab: Make sure SQK's are checked for systems you want to monitor.
Edit Favorites List>System>Options tab: Make sure 'ID Search' is On if no IDs are programmed.
Edit Favorites List>System>Dept/Site Quick Keys Status tab: Make sure Department/Site QK's are checked for departments/sites you want to monitor.
Edit Favorites List>System>Dept/Site>Location tab: Make sure Departments/Sites have locations programmed if 'Use Location Control' is set to On for the FL.

First, delete all the Quick Keys. Since you only have one FL, they won;t do any good anyway.

Next, make sure ALL your Service Types are enabled. That is likely the core issue.

Make sure you see your FL when you hit MENU / Set Scan Selection. If not, you didn't enable the list for download in your profile. If it is there, make sure it's set to ON under Select Lists To Monitor.

#1 is only true if you have Location Control enabled for the FL.

Technically it's correct if you're only monitoring the main dB.

Can you upload your "code plug" and we can look at it? In your Profile see if you have under the first tab "Scan Selection" your "Favorites Lists" marked to Monitor. If not, they may not be active in your 536. Also, when you click on any of your favorites, are they showing up red? /\/\|k.e

Menu>Edit Custom Search>Select Custom>Edit Srch Limit>Set Lower Limit>Set Upper Limit. And then go back and give it a name and set up the other parameters (AM, FM, etc, AGC, attenuation, etc.

But you need to use frequencies the radio will accept. I tried 851MHz and the 536 said it’s out of band.

851.000 MHz is half in the Cellular band which is blocked. Use 851.0125 and 868.9875 for the search (as 869-894 is also the Cell band). Then set up a second search with 894.0125 to 899 MHz (although those are mobile inputs to 900 SMR, so you likely won't hear much there).

If I remember correctly the earlier cell phone frequency's were 824-848 and 869-893. Almost all scanners (unless you mod or buy an export model) will have these blocked.

Local public safety can be interesting and informative.
I dread the thought that it could happen in my area.

There are many things to listen to but not like public
safety. One is listening to aircraft communications.
There seems to be two public airports in Mobile:

http://www.airnav.com/airport/KMOB
and
http://www.airnav.com/airport/KBFM

In each case, scroll down to “Airport Communications”
for frequencies. Start with the tower frequencies.

Aircraft communications uses a different language
so it can be confusing at first but it can be learned.
Actually, for me at least, it was fun figuring out what the
aircraft were doing up there based on their communications.

Unlike other types of listening, the FAA has tons of
information on line for pilots and for Air Traffic Controllers
that scanner listeners can learn from.

I also enjoy listening to railroad communications. They
speak yet another language. You can find the railroad
channels here on the blue chart:
http://on-track-on-line.com/scanner-radio.shtml

Maybe a less popular thing to do with scanners is to see
what is out there by searching the bands over and over.
I do this and log everything that I can identify. You will
run into all kinds of things – taxis, power companies, businesses,
ambulances, and the list goes on. This can be very useful
in figuring out what is what:
http://www.radioreference.com/apps/db/?stid=1

For some, amateur radio communications can be interesting.
Some repeaters are more interesting to listen to than others.
Some are way more active than others. Over time you may
find ones you prefer. Here is one list:
http://www.radioreference.com/apps/db/?stid=1&tab=ham
and another
http://www.qsl.net/kd4nid/Alabama_Repeaters_by_county.htm

Iden – Northern California

From: kstrsdn@...
Topic: 5689 Message: 5689

I know this question from me is getting very onld on this group, but I truly don't get it. I am having a real problem with trying to monitor favorites. I continue to get "NOTHING TO SCAN". The kind people out here have offered suggestions and have a few times sent me the quick check list. I have NOT had any luck accomplishing this. As I mentioned before, Under Favorites, I have called my list FAVORITES. When I click FAVORITES I get Michigan Public Safety Communications Systems (MPSCS). When I click MSPCS, I have 9 Departments programmed . All I want to do is scan my 9 department with FAVORITES when I turn the scanner on. If I have to program FL keys or quick keys etc... this may be my problem which I have a hard time understanding.
Please help me solve this.

You mention that you have departments programmed. Do you have any sites programmed and enabled? If not, you have NOTHING TO SCAN.

Dean,

The “Nothing to Scan” list of corrective action is a comprehensive listing of all that could be causing your problem.

I am willing to help you offline. Everything up to an including my putting together a FL that will work. My email is n1chu@.... Send me an email.

Siren, (groan). Got so disgusted with what was originally promised and what iPhone users finally ended up with, I ignored it all together because I got sick at even the thought of it! If I never heard or saw the feature (or lack thereof), it would be too soon.

But, some time has passed, I’ve mellowed. I understand Uniden did its best to find a workaround... and was able to kill an intended lawsuite?

Wonder if a revisit is worth the effort?

Trade: BCD536HP for Home Patrol II I am looking for an even up trade, for my pristine no smoker, mint condition Uniden BCD536HP for the same condition Uniden Home Patrol II scanner. I have the box, manual, bracket, power cords and unused batteries. The unit is a 10 out of a 10 functionally and cosmetically. I do not want an original (HP1)Home Patrol because I already have one. If interested, please let me know what you have.

5698. Database want

Yahoo group: BCD536HP
Date: 2018-08-21 06:05:14 UTC
From: Rick WA6NHC
Topic: 5698 Message: 5698

Hello all,

Here in the Inland North West, it's fire season (as other places). This means that a LOT of Fed firefighters are moving in/out of the area, using their home frequencies as they work the fires. They're mostly USFS, some are aircraft.

Since on never knows where they will be from (or country even) and they don't use the posted (Idaho for example) channels, it would be convenient to have ONE place in the Sentinel database to grab ALL the various Fed frequency groups in one place for times like this. One CAN grab them from various other areas (CA, AZ etc) and plug them into one group, tedious and likely something would be missed. One can also incorporate the entire database without setting range limits but that's a gross excess of scanning, it take too much time with things that don't apply.

I would suggest that for clarity and simplicity, creating ALL the Fed channel as another 'state' would be the cleanest means to present this. That 'state' could be broken into agencies (BP, DHS, USFS, NP etc). I've also noticed a shift in usage (DHS using USFS listed assignments and vice versa), so the list seems... transient.

Such a list is available on RR, but I'm not seeing it in Sentinel. Please add it.

While I have the moment, adding the 'Victor' aircraft channels would be nice too for those areas with the larger fires.

Yes, I realize that this is a topic always in flux and I commend those in charge of keeping the database coherent and sane.

Thank you,
Rick wa6nhc

A valid point. Searching the VHF & UHF spectrum is time consuming, and not all that effective. And your asking for a national (or international-include Canada) compilation that could be automatically downloaded is doable. Especially since there is already a compilation listed in RR. RR could add this listing to the National tab and satisfy your request. So, why have you received no response to date from an administrator at RR? It's probably because your requesting on this group hasn't been picked up by RR? If so, it's easily rectified...

I would attempt to forward your post to RR directly but not wanting to "steal your thunder", possibly having RR think I was to be credited for your suggestion, I propose that you forward to them your idea... see what they have to say on the matter-there may be reasons they have not already done this. I know in the State of Ct., there are frequencies for the Forestry that have been re-allocated to the Fire Service. RR could have looked at issues such as this, and others I am not aware of, and decided not to do as you suggest.

Information only. Why are/were reassignments allowed?
The re-assignment of Forestry frequencies is/was mainly due to the manner in which frequencies were assigned. The people in charge of assignments ran out of frequencies allotted for the various services in the respective bands (VHF, UHF)... there was only a finite number to be assigned. So, they looked elsewhere within the same band for available frequencies allocated to other services. In the cases in Ct. (and other states), where additional frequencies were needed, they took from the Forestry allocation-acceptable as the Forestry Service was never really part of the region's needs... if they weren't using them why not?... it's a different story out west! I don't think that allocation system where the FCC designated a portion of each band to specific services is as strictly enforced anymore, or if it's been dropped all-together?

This is off topic but when I got to thinking about the Forestry Service and the suppression crews, I recalled a video about the Forest Service's communications I fell into when researching stock portable antennas, both amateur and commercial. As the Forestry Service is a very large user of portable radios. (They have a cache of radios they must maintain and a full-time staff that issues, retrieves and tests radio gear. The stats on defective antennas was very interesting. Even with the crews conscious of the importance of keeping their radios protected, as without them they are in dire jeopardy, they were still subjected to wear and tear much higher than normal. The antennas took an awful beating. I forget the percentage of bad antennas found but suffice to say it reached a point where the antennas are probably replaced after each assignment as a matter of course. The take away here is never ignore the antenna as a possible cause for poor reception, be it a commercial or amateur transceiver or a scanner! Rubber duckies may be flexible, but they can break too.

Let us know if you intend to submit directly to RR, and their response to your suggestion.

Go ahead and forward if you wish, I'm not interested in thunder. I know that the list admins monitor here, but there has been no response.

It's my understanding that the FCC no longer assigns freq for Fed use, so anything could be anywhere. I tripped on a Border Patrol use of a Forestry freq up here in the boonies, which was quickly added to the database when submitted (the P25 kinda gave it away, all LE chatter).

As we do not have massive influxes of forestry crews here in Ct., there is no interest in a listing. So, I have no interest in submitting to RR. I didn't intend to actually offer as such... just a way of suggesting you do instead. But with your understanding that RR monitors this group, it's not necessary.

And there is always "cut and paste" which would take longer than if it were listed as you suggest, but it's still a lot quicker than manually entering each frequency.

Something like this would probably be better handled via a Favorites List. While some of these channels may be in the Nationwide database they are actually pretty limited in operation to the western states.

See if someone already has built such a Favorites List for that and see if they can share it with you. I doubt very much that Uniden and RadioReference will alter the database structure to support your request, as good of an idea as it is.

5704. Re: [BCD536HP] Database want

Yahoo group: BCD536HP
Date: 2018-08-22 19:04:59 UTC
From: Rick WA6NHC
Topic: 5698 Message: 5704

The point, is that a favorite list cannot be created without excessive tedium since the assignments (incomplete as well since they're being reassigned almost daily) are splattered throughout the entire database. This requires the user to go through EVERY state, EVERY county to glean what could/should be in one location. The info is already in the database, it should be simple to add another 'state' in the list, broken down by discipline (DHS, NPS etc.). (Yes, Canada as well please, I'm only 30 miles away, eh!) An existing favorite list would be out of date soon, because of the reassignments, requiring yet ANOTHER search of the entire database. For best accuracy, this would mean redoing the list EVERY weekly update.

There is no reason to not make it simpler, it's already there in the database. (Yes, this would involve RR as well since the Fed pages haven't been updated lately either.) I'm not ranting, but I'm VERY hopeful of a positive response.

I doubt that this is a western states only issue, since the SE burns annually as well as some southern states. Perhaps they don't use Fed resources, I have no idea.

Or do the same thing as the NIRSC, NIFC and other Fed plans already posted.
